## A

### ADJOURNMENT (See also "SPEAKER"; also "NO QUORUM") :—

#### OF DEBATE :—

Motion made for, and passed (*to take precedence*), 13, 16, 18, 20, 22; 41, 60, 73, 79, 109, 111, 146, 224, 280.

Motion made for, and negatived, 100.

#### OF THE HOUSE :—

Motion made for, and passed, 1, 13, 16, 18, 20, 22, 25, 30, 41, 49, 66, 72, 74, 82, 92, 133, 158, 206, 210, 222, 261, 302.

Motion made for, and House counted out, 178.

Motion made for special, and passed, 235, 302; (*Centenary of the Establishment of Parliamentary Institutions in N.S.W.*), 86.

As a mark of respect on death of the Honorable Sir David Storey, Kt., M.L.C., a former Member and Minister, 55.

#### OF THE HOUSE, UNDER THE 49TH STANDING ORDER :—

Ruling of Speaker respecting Notices drawn from Box after 6.30 o'clock on days on which Government Business takes precedence at that hour, 198.

#### Negatived :—

The action of the Broken Hill Proprietary Company in introducing a twelve-hour day into a portion of their works at Newcastle (*Major Connell*), 28.

The failure of the Government to hold a full inquiry into the proposal of the Master Bakers to increase the price of bread (*Mr. Gosling*), 32.

Unemployment at present existing at the South Coast mines (*Mr. William Davies*), 36.

The action of the Government in depriving tunnel-workers on the City Railway and the North Sydney Construction Works of the forty-four hour week (*Mr. Murphy*), 62.

The refusal of the Government to use the pipes ordered by the Metropolitan Board of Water and Sewerage from Hoskins' Iron and Steel Company, thereby depriving one hundred and forty men of employment (*Mr. Gosling*), 77.

The arrival in this State of labourers and others from foreign countries (*Mr. Baddeley*) 81.

The unfair treatment of public servants recently retrenched in regard to compensation payments (*Mr. Lazzarini*), 86.

The arrival of numerous foreigners in a destitute condition into the City of Broken Hill (*Mr. Davidson*), 89.

The immediate necessity for legislation to be introduced to prevent such scandals as witnessed at the recent Artists' Ball held in the Town Hall of the City of Sydney (*Mr. Arkins*), 93.

The proposed sale of "Ormonde House," Paddington, by the Minister for Public Instruction (*Mr. Birt*), 109.

Action of the Railway Commissioners in refusing to take railway-sleepers and other timber supplies from the Wyong-Dora Creek districts (*Mr. O'Hearn*), 201.

The necessity for the Government to take action to abolish the Shipping Labour Bureau (*Mr. McTiernan*), 216.

The action of the Government in appointing Mr. McDougall as Assistant Comptroller-General of Prisons (*Mr. McKell*), 241.

#### Ruled out of order :—

The inhumane and vindictive action of the Government in persecuting and prosecuting the seven representatives of the Transport Workers' Group for their humane action in advising members of the Seamen's Union to refuse to work the *Port Lyttelton*, such boat having been declared unseaworthy; and further the action of the Government in advising Judge Edwards to refuse to grant bail in such cases, ruled out of order for the reason, amongst others, that it contained more than one subject (*Mr. Davidson*), 45.

The proposed payment by the Government of £5,000 to compensate the loyalists on the water-front, as a result of the High Court's decision that preference must be given to returned soldiers,—as the matter was capable of discussion on the financial statement (*Mr. Frank Burke*), 143.

The financial difficulty caused through the failure of the Commonwealth Note Issue Board to issue sufficient Bank Notes to facilitate the financing of the Trade of the Country,—as the matter was capable of discussion on the Financial Statement (*Mr. Scott Fell*), 149.

### ADMINISTRATION OF JUSTICE :—

#### PROSECUTION OF REPRESENTATIVES OF THE TRANSPORT WORKERS' GROUP FOR ADVISING MEMBER OF THE SEAMEN'S UNION TO REFUSE TO WORK THE *Port Lyttelton* :—

Notice given under the 49th Standing Order for adjournment of the House to discuss, and ruled out of order, as containing more than one subject (*Mr. Davidson*), 45.

Motion made as a matter of urgency to consider a Notice of Motion on the Notice Paper relating to, and negatived (*Mr. McTiernan*), 61.

Ministerial Statement (*Mr. Bavin*) made in connection with, 65.

### ANZAC PARADE (See "PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS").

### APPIN MURDER (See "CAPITAL PUNISHMENT.")

1924.

SEAMEN'S UNION (See "ADMINISTRATION OF JUSTICE").

SELECT COMMITTEES (See "COMMITTEES").

SENATE (See "FEDERAL").

SERJEANT-AT-ARMS (See "MEMBERS").

SESSIONAL ORDERS (see also "STANDING ORDERS") :—

Passed, 29<sup>(8)</sup>, 30<sup>(2)</sup>.

Precedence of Business, 29.

Do do on Tuesdays, 100.

BUSINESS DAYS AND HOUR OF MEETING (*Sessional Order*) :—

Motion made (*Mr. Oukss, on behalf of Sir George Fuller*), That unless otherwise ordered, this House shall meet for despatch of business at Four o'clock p.m. on Tuesdays, Wednesdays, and Thursdays in each week, and amendment (*Mr. Birt*) to leave out the word "Four" and insert the word "Two" instead thereof—negatived, Sessional Order passed, 29.

ADDITIONAL SITTING DAY (*Friday*) :—

Motion made (*Sir George Fuller*), That during the remainder of the Session, unless otherwise ordered, this House shall meet, for the despatch of business, at 2 o'clock p.m., on Friday in each week, and Government Business only shall be dealt with, and debate adjourned, 228; Debate resumed, amendment (*Mr. Bulkeley*) for Day Sitings negatived, motion agreed to, 234.

SHIPPING (See also "ADMINISTRATION OF JUSTICE") :—

LABOUR BUREAU :—

Motion made (*Mr. McTiernan*), under the 49th Standing Order, for the adjournment of the House to discuss the necessity for the Government to take action to abolish and negatived, 216.

SIMPSON, W. G. G. (See "CAPITAL PUNISHMENT").

SLEEPERS (See "RAILWAYS").

SOLDIERS (See "LOYALISTS").

SOUTH AFRICAN WAR CASUALTIES RELIEF FUND (See "NATIONAL RELIEF FUND ACT, 1914—ADDITION TO SCHEDULE").

SOUTH COAST (See "ADJOURNMENT").

SPEAKER :—

Announced receipt during recess, and read to the House a letter from the Lieutenant-Governor, intimating the Resolution adopted by the House last session in reference to the "Granting of Titles," had been laid before the King, 8.

Announces retirement of Mr. F. Walsh as Parliamentary Librarian, and makes remarks in reference to, 7-8.

Announces appointment of Mr. J. J. Quinn as Parliamentary Librarian, 8.

Clerk informs the House of unavoidable absence of, and Deputy-Speaker takes the Chair, 65, 67, 71, 113, 139, 155, 167, 169.

Disorder in Divisions—Statement in reference to, 28.

Enters the House and takes Chair, 115, 140, 156 (to receive report from Committee, being the first opportunity after commencement of Business), 167.

Lays on Table Warrant appointing Temporary Chairmen of Committees, 7.

Do do do do Committee of Elections and Qualifications, 7; reports maturity of warrant, 21.

Lays papers on Table, 8<sup>(2)</sup>, 77, 193, 295.

Orders removal of Member by Serjeant-at-Arms, 18, 23.

Reads Governor's Opening Speech, 11.

Reports reply from Lady Storey to resolution of sympathy, passed by House, on the death of the Hon. Sir David Storey, Kt., M.L.C., 71.

Reports presentation of Address in acknowledgment of Message notifying appointment of Sir Dudley Rawson Stratford De Chair, K.C.B., M.V.O., as Governor of New South Wales, and reads reply, 55.

RULINGS OF :—

INTERPRETATION OF STANDING ORDER 295—POINT AT WHICH PROCEEDINGS ON A BILL SHOULD BE RESUMED :—

That the Member upon whose motion the Debate on the 2<sup>o</sup> of a Bill of a previous Session was adjourned should, on resumption of proceedings, proceed with his Speech forthwith, 52.

ON MOTIONS FOR ADJOURNMENT OF THE HOUSE UNDER THE 49TH STANDING ORDER :—

That the motion in reference to "Prosecution of Representatives of the Transport Workers' Group for advising members of the Seamen's Union to refuse to work the *Port Lyttelton* was out of order for the reason, amongst others, that it contained more than one subject, 45.

That the motion in reference to payment of Compensation to Loyalists on the waterfront as a result of a decision of the High Court, was capable of discussion on the Financial Statement and was out of order, 143.

That the motion in reference to the "Issue of Bank Notes," was capable of discussion on the Financial Statement, and was out of order, 149.

DRAWN FROM BOX AFTER 6.30 P.M. ON TUESDAYS :—

That owing to the operation of the Sessional Order, directing that Government Business shall take precedence of General Business after 6.30 p.m. on Tuesdays, construed with Standing Order 123A, it was not competent to move a motion for adjournment drawn from the Box after 6.30 p.m. on Tuesdays, 193.

RULINGS OF DEPUTY :—

That the Local Government (Amendment) Bill did not impose any burden on the Consolidated Revenue Fund—it related to local rates; a message from the Crown was therefore not required, 205.

1924.

REFERENCES TO THE VOTES AND PROCEEDINGS, VOL. I—26TH PARLIAMENT—FOURTH SESSION.

**S**

SPEAKER—*continued* :—

RULINGS OF DEPUTY—*continued* :—

ON A MINISTERIAL STATEMENT :—

That a Minister was entitled to make a Ministerial Statement, that such a statement would not anticipate discussion on a Notice of Motion on the Notice Paper in the general acceptance of the term, 65.

Point of Order taken on 3<sup>d</sup> of a Bill.

That he could not uphold the Point of Order "That clause 52 inserted in Committee in the Main Roads Bill was outside the Order of Leave and outside the scope of the Bill," 115.

AMENDMENT OF ACT, IN SAME SESSION, AS THAT IN WHICH IT WAS PASSED :—

That the Sydney Corporation (Further Amendment) Bill was in order, notwithstanding it was an amendment of the Sydney Corporation Act passed this Session—such an amendment being authorised by the Interpretation Act, 249.

SPECIAL ADJOURNMENT (See "ADJOURNMENT").

STANDING ORDERS :—

Interpretation of Standing Order 295,—Point at which proceedings on Bills should be resumed, —Ruling of Speaker, 52.

Sessional Order appointing Committee, 30.

Motion to suspend to bring in and pass Bills through all stages in one day, Urgency, 150, 172.

Motion to suspend to bring in and pass Supply Bill through all stages in one day, 136.

Motion to suspend Sessional and (Urgency), to consider Notice of Motion on Notice Paper and the continuation of Debate after 6.30 p.m. agreed to, 127.

Motion to suspend to consider General Business at a Friday Sitting, Urgency, agreed to, 253, 279.

Motion referring the question of Printing of Evidence taken before Select Committees to the Committee for consideration, 33.

## NEW SOUTH WALES.

NEW SOUTH WALES GOVERNMENT RAILWAYS AND  
TRAMWAYS.REPORT OF THE COMMISSIONERS FOR THE YEAR ENDED  
30 JUNE, 1924.

Office of the Railway Commissioners for New South Wales,

Sydney, 2nd September, 1924.

TO THE HONORABLE THE MINISTER FOR RAILWAYS.

SIR,

In accordance with the provisions of section 40 of the Government Railways Act of 1912, as amended by the Government Railways (Amendment) Act of 1916, and as subsequently amended, we have the honor to submit, for the information of Parliament, our report upon the working of the Railways and Tramways for the year ended 30th June, 1924.

The financial results, compared with the previous year, are as follow :—

## Year ended 30th June.

	1924.			1923.		
	Railways.	Tramways.	Total.	Railways.	Tramways.	Total.
	£	£	£	£	£	£
EARNINGS ... ..	15,616,577	3,633,916	19,250,493	15,221,333	3,598,114	18,819,447
WORKING EXPENSES ...	10,917,491	3,091,531	14,009,022	10,649,974	3,092,306	13,742,280
Balance—Net Earnings paid to credit of Consolidated Revenue	4,699,086	542,385	5,241,471	4,571,359	505,808	5,077,167

The Net Earnings show a return on the total Capital invested of—

	£	s.	d.	
Railways ... ..	5	2	7	per cent.
Tramways ... ..	5	4	8	„ „
Combined ... ..	£5	2	10	per cent.

This result it is felt will be generally appreciated, more especially when it is stated that during the year the equipment and permanent way have been fully and efficiently maintained, railway rates and fares reduced, tramway revenue curtailed by reason of the withdrawal on the 11th February, 1923, of the additional 1d. fare on Sundays, Christmas Day, and Good Friday, and wages increased by the Board of Trade's determination in September last. These latter factors adversely affected the net revenue, in comparison with the previous year, to the extent of—Railways, £272,000, and Tramways, £107,000.

It should be pointed out also that in consequence of the unceasing attention given to the question of transportation charges, railway and tramway users have been granted substantial concessions during several past years. There have been no increases in the general incidence of freights and fares since November, 1920; on the contrary, a considerable number of freight reductions, mainly designed to assist both primary and secondary industries, have been allowed. Passenger fares have also been reduced in favour of a large number of the travelling public.

These successive reductions have meant an accumulated relief at the rate of no less a sum than £700,000 per annum, and caused a loss of revenue in the year under review of £571,000. In other words, had freights and fares not been reduced this sum would have been taken from the railway and tramway users during that period for the same amount of service.

After deducting from the net earnings interest charges on the interest bearing capital invested, calculated at the average rate of interest paid on the whole of the State debt, which amounts to:—

Railways ... ..	£4,693,417
Tramways ... ..	532,187

£5,225,604

the net results of the working for the year were:—

Railways ... ..	surplus	£5,669
Tramways ... ..	surplus	10,198

Total surplus ... .. £15,867

As compared with the preceding year the total increases in the interest bill were:—Railways, £206,114; Tramways, £31,913.

The appended diagram illustrates, on a £1 unit basis (the circle being drawn to represent a sovereign), how the railway earnings are disposed of. It will be seen that out of every twenty shillings earned six have to be utilised to meet interest charges. The smaller circle indicates the proportions of railway revenue exhausted in paying salaries and wages (labour), interest, and all other costs (materials and miscellaneous).

RAILWAYS.

## RAILWAYS.

During the year the following extensions were opened for traffic, viz. :—

				Date Opened, 1923.	Miles.	Chains.
Coonabarabran to Gwabegar	...	...	...	...10th Sept.	59	6 $\frac{3}{4}$
Tarana to Oberon	...	...	...	... 3rd Oct.	15	7
Binnaway to Werris Creek	...	...	...	...29th Oct.	91	52 $\frac{3}{4}$
Macksville to Urunga	...	...	...	... 3rd Dec.	17	20
Gilmore to Kunama	...	...	...	...17th Dec.	21	44 $\frac{3}{4}$

The number of miles of line open for traffic on the 30th June, 1924, was 5,522 $\frac{3}{4}$ . (See Appendix XIV.)

The expenditure charged to Capital Account during the year was £4,078,296. (See Appendix XIII.)

The total capital expenditure on lines open for traffic on the 30th June, 1924, was £93,355,167. (See Appendix VIII.)

The gross earnings have increased from £15,221,333 to £15,616,577, a gain of £395,244, or 2·60 per cent. over last year.

The increases and decreases from the various sources of earnings as compared with the previous year are as follow :—

			EARNINGS.		TONNAGE.	
			Increase.	Decrease.	Increase.	Decrease.
	1924.	1923.	£	£	Tons.	Tons.
Passengers, No. ...	128,101,184	123,714,639	72,286	.....	.....	.....
Parcels, &c. ....			31,249	.....	.....	.....
Refreshment Rooms .....			45,765	.....	.....	.....
General Merchandise .....			.....	33,566	36,566	.....
Wool .....			.....	50,415	.....	12,436
Live Stock .....			.....	215,978	5,716	.....
Hay, Straw and Chaff .....			56,610	.....	37,498	.....
Grain, Flour, &c. ....			245,115	.....	347,758	.....
Coal and Coke.....			184,187	.....	1,354,244	.....
Minerals (other than Coal and Coke).....			41,552	.....	122,471	.....
Miscellaneous .....			18,439	.....	.....	.....
Earnings and Tonnage .....	£		395,244	.....	1,891,817	.....

The increase in the earnings was due to additional business, while, on the other hand, direct losses of revenue to the extent of £181,865 were incurred principally by the transport at reduced rates of store stock and starving stock travelling for feed; carriage of fodder at reduced rates to drought-stricken areas, and the free return to their original pastures of a very large number of stock which had been carried on the forward journey under starving stock conditions.

## TRAIN MILEAGE.

The mileage results are:—Of passenger trains, 11,822,364 miles; of mixed trains, 1,686,997 miles; of goods trains, 10,197,627 miles; the aggregate being 23,706,988 miles, or an increase of 2,013,127 miles as compared with the previous year.

## PASSENGERS CARRIED.

During the year 128,101,184 passengers were carried, as compared with 123,714,639 in the previous year, or an increase of 4,386,545. No passengers were fatally injured by accidents to trains during the year.

## WORKING

## WORKING EXPENDITURE.

The working expenses amounted to £10,917,491, as compared with £10,649,974 last year, an increase of £267,517, and absorbed 69·91 per cent. of the earnings.

The operating ratio is ·06 per cent. lower than in the previous year, notwithstanding the following addition to the working cost beyond the control of the administration and adverse conditions due to the very large business done during the year in the transport of starving stock, which were carried at reduced rates on the forward journey and free carriage, at full working cost to the Department, on returning to their original pastures.

Increased payments in wages and salaries consequent on the determination of the New South Wales Board of Trade, dated 7th September, 1923, given effect to from 30th September, 1923, to certain staff, and from 12th October, 1923, to the remainder of staff, in respect of the basic wage, and <i>pro rata</i> increases to members of the staff already paid at higher rates than the basic wage ... ..	£
Increased payments in wages and salaries under awards of the Commonwealth Court of Conciliation and Arbitration and of the State Court of Industrial Arbitration issued during the year, and awards of the previous year not operative during the whole of that year ... ..	198,500
Automatic increases due to awards of the Commonwealth Court of Conciliation and Arbitration and of the State Court of Industrial Arbitration, and advances in pay approved by the Commissioners to equalise conditions created by awards ...	32,280
	66,184
	296,964
Less :	
Saving due to the restoration of the working week to 48 hours ... ..	201,067
	92,897

## RATES AND FARES.

Reductions in passenger fares and further reductions in goods rates to the extent of £399,000 per annum were made during the year, the estimated loss in revenue in the current year being £179,900. The cumulative annual loss of revenue due to successive reductions in rates and fares since the year 1921, amounts to approximately £700,000.

## TRAFFIC.

The year's work has involved the operation (gross) of :—

Passenger ton miles ... ..	2,169,862,830
Goods ton miles ... ..	3,984,366,661
Total ... ..	6,154,229,491

an increase in the aggregate of 579,988,649 ton miles as compared with last year's working.

The earnings per 1,000 ton miles were :—

	£	s.	d.
Passenger ... ..	3	9	0
Goods ... ..	2	0	9
Combined ... ..	2	10	9

a decrease of 3s. 10d. as compared with the previous year.

## REFRESHMENT ROOMS.

The expenditure in connection with Refreshment Rooms amounted to £456,565 and the receipts to £517,322, showing a surplus of receipts over expenditure of £60,757 for the year. Dealing with the business as a separate undertaking, and allowing for interest on capital invested and other charges, the net profit is £23,069, a decrease of £1,076 as compared with the previous year.

ANNUAL REPORT OF THE COMMISSIONERS.

5

The following statement shows the earnings and expenses in connection with a number of lines:—

\* Profit.

The statement shows that on these lines of an aggregate length of 3,544 miles 44½ chains the capital expended is £29,514,156.

The net earnings amounted to £280,313 against an interest charge of £1,488,137, or a loss on the year's working of £1,207,824.

SIGNALLING

## SIGNALLING, SAFETY APPLIANCES, &amp;c

The outstanding feature of the signalling work carried out during the year has been the installation of the new West Signal-box in Sydney Yard. In connection with this new signal-box, complete track circuit equipment for the protection of point and signal movements has been installed. This form of protection is now in use from Sydney throughout the interlockings in the suburban areas as far as Lidcombe, Rockdale, and Canterbury, thus affording safeguards for the intensive traffic movements within these areas.

Upon the suburban lines generally the automatic signalling system has been extended to Kogarah and Bankstown, and has been installed upon the new line between Enfield and Cabramatta. Automatic signalling has also been installed in connection with the quadruplication of the lines between Cook's River and Rockdale, and between Flemington and Lidcombe.

In the country automatic signalling has been extended from Bowenfels to Wallerawang in connection with the duplication and deviation on this section.

Signalling work has also been carried out during the year on the new extensions from Coonabarabran to Gwabegar, Tarana to Oberon, Macksville to Urunga, Werris Creek to Binnaway, and Gilmore to Kunama.

The interlocking of points not previously interlocked has only made slow progress due to the pressure of other work. The proportion of non-interlocked connections in passenger lines has been reduced during the year from 8.44 per cent. to 7.72 per cent.

Work on the line wires, chiefly in connection with the improvement of the telephone services, has been in hand throughout the system, and telephone instruments of obsolete type have also been replaced by more modern instruments, thus greatly facilitating this means of communication. The work of improving the block working apparatus and its co-ordination with the outdoor signals has also been continued.

## METHOD OF WORKING.

The following are the comparative particulars of the various systems of working in 1924 and 1923:—

	1924.		1923.		Increase.		Decrease.

By train staff and ticket, without line clear reports ... ..	735	66	720	63	15	3	—	—
By train staff and one engine only ...	76	15	76	15	—	—	—	—
Totals ... ..	4,866	20	4,665	32	217	24	16	36

The safe working equipment now in use throughout the lines includes 433 signal-boxes, 23,679 lever units, 475 block instruments, 496 electric staff and tablet instruments, 16,372 miles of line wire, 1,132 power-worked points and signals, and 423 automatic signal arms.

## CONDITION OF WAY, WORKS, AND BUILDINGS.

The permanent way, bridges, buildings, fences, and wharves have been efficiently maintained during the year.

Although hampered by a shortage of rails, the full year's programme of renewal of the permanent way was almost carried out.

The length of line wholly or partially renewed by relaying, rerailing, or resleepering, was 301 miles 63 chains; a further length of 541 miles 37 chains has been reballasted, of which 276 miles consisted of metal, sand, and gravel, and 265 miles ashes, making a total of 843 miles 20 chains of line either partially or completely renewed during the year. In carrying out these renewals, 17,209 tons of rails, 723,042 sleepers, and 196,610 cubic yards of ballast were used. With the object of preventing rail creeping and effecting economy in maintenance, a length of 38 miles 53 chains of line has been equipped with rail anchors, 36,840 anchors having been used for this purpose.

The buildings throughout the system have been maintained in good order, and a large number repainted at a cost of £12,100. Additions and improvements, costing £45,300, have been effected and charged in the working expenses of the year.

NEW

## NEW WORKS.

Additional accommodation to provide adequate facilities for dealing with the increase of business has been provided as follows:—

New station buildings and additions and improvements to existing buildings at Sydney, Croydon, Flemington, Arncliffe, Banksia, Wombarra, Mount Drummond, Port Kembla, Cabramatta, Liverpool, Leumeah, Bundanoon, Pendle Hill, Warrimoo, Goulburn, Harden, Junee, Wagga Wagga, The Rock, Gerogery, Temora, Beekom, Yenda, Orange, Trangie, Armatree, Muswellbrook, 104 m. 22 c. North Coast line, Booshang, Billinudgel and Kyogle.

The refreshment-room accommodation has been added to and improved at Sydney, Wollongong, Cooma, Parkes and South Grafton.

Additions and improvements to the rest-house accommodation for the staff have been carried out at Gwabegar, Batlow, Parkes, Werris Creek, and Grafton; new buildings for departmental residences and additions and improvements to existing buildings have been provided at Yerrinbool, Coolah, Henty and Spring Hill.

New buildings for the Railway Institute have been erected at Harden, Temora, Singleton and Murrumbidgee, and additions made to the existing building at Orange.

New trucking yards and additions to existing trucking yards have been erected at Bowral, Pymble, Henty, Bethunga, Tallimba, Condobolin, Farley, Ravensworth, Werris Creek, Wallangarra, Breeza and Walgett.

Additional locomotive accommodation has been provided at Eveleigh, Enfield, Tarana, Eskbank, Mudgee, Hornsby, Goulburn, Temora, Culcairn, Tallimba, Bathurst, Cowra, Canowindra, Parkes, Werrinnya, Broadmeadow and Murwillumbah.

Additions to water supplies have been made at Sydney, Riverstone, Penrith, Binnaway, Temora, Barellan, Mandagery, Kootingal, Armidale and Dingo Creek.

Footbridges and subways have been provided at Hazelbrook and Armidale, overbridges at Menangle viaduct and Hamilton, and underbridges at Tempe (over Cook's River), Minnamurra River, 186 miles 45 chains Coonabarabran line and 62 miles 48 chains Northern line.

Additional siding accommodation has been provided at thirty-seven stations, the more important of the works being at Clyde, Kogarah, Hurstville, Sutherland, Mount Drummond, Punchbowl, Tabmoor, Yerrinbool, Eskbank, Castle Hill, Charbon, Mudgee, Ryde, Hornsby, Hawkesbury River, Temora, Leeton, Trangie, Broadmeadow and Billinudgel.

Weighbridges have been installed at Marulan, Wollongong, Bombo, Buralyang, Langtree, Merriwagga, Corobimilla, Pamandi, Young, Ootha and Kamber, and cranes at Leeton, Garema, Newcastle and Coramba.

A new wharf has been erected at Hawkesbury River.

A level crossing has been provided at 66 miles 30 chains Southern line, and cattle stops at 201 miles 33 chains Molong line and 347 miles 49½ chains Coonamble line.

Electric lighting has been installed in sixteen additional suburban stations and sixteen country stations, and, in addition, a large number of miscellaneous lighting works have been carried out. Improved lighting facilities have also been provided at Eveleigh workshops, and a scheme for a more adequate lighting of the whole of the shops is in hand. A new electric light depot has been built at Sydney Station, and is almost ready for use. The work in connection with the 50-cycle lighting supply at Darling Harbour and Sydney is practically complete. Additional electric lighting equipments have been fitted to railway and steam tramway rolling stock.

The construction of a tunnel for electric transmission cables under Sydney Harbour, from Longnose Point to Greenwich, is practically complete; two special junction houses have still to be provided at each end of the tunnel, as well as some shelving at the curve of the tunnel.

The works at Chullora, comprising the erection of locomotive workshops, signal engineer's depot and electric car shops are making progress. The foundations for the whole of the machines to be erected in the new locomotive shops have been completed with the exception of the pit rivetters. The roof of the northern and southern bays of the boiler shop is practically finished, and that of the middle bay is about five-eighths done. Travelling gantries have been erected in the northern and southern bays. The earthworks in connection with the signal engineer's depot are so advanced that a commencement will, it is expected, shortly be made with the erection of the buildings. Platelaying from Chullora Junction to the site of the depot is practically complete. The excavation for the foundations for the electric car shops is well advanced, and temporary rails have been laid from Chullora Junction to the site for the shops to facilitate the handling of material for concreting.

A new carriage shed is now under construction at the eastern side of Sydney Yard; the renewal of the underbridge at Minnamurra River, remodelling work at Cowra, a new locomotive depot at Eskbank, additional locomotive and traffic accommodation at Broadmeadow, and the construction of a third road between Broadmeadow and Woodville Junction have been completed. The erection of a new island platform and station buildings between Eskbank and Lithgow is well advanced, the brickwork and roofing of the main station building and the overbridge at Banks-street having been completed.

The

The work in connection with the proposed train ferry across the Clarence River has kept pace with the delivery of material. The retaining walls for the approach to South Grafton and the foundation for towers are well in hand. At the Grafton end the earthworks have been completed and the trestling for the approach is nearly finished. Platelaying of sidings is well advanced. The alterations to the s.s. *Swallow*, which will be used as a ferry, will be completed in a few weeks.

To provide for the requirements in connection with the erection of a bridge over Sydney Harbour, extensive re-arrangements were made at the new Milson's Point station, which was brought into use on the 28th of July last.

#### DUPLICATION OF THE LINE.

The duplication and deviation of the section from Middle River to Cox's River has been completed and opened to traffic.

In connection with the duplication between Thirroul and Wollongong, the construction of a goods siding at Bellambi and a footbridge at Wollongong referred to in our last report, have been completed. Work is still proceeding with the construction of an overbridge in lieu of Mount Pleasant crossing.

The quadruplication of the lines from Flemington to Lidcombe made such progress during the year as to permit of the first stage of this work being opened to traffic between Flemington and the double junction, near Lidcombe, on the 16th June last, thus bringing into use the new island platform at Flemington. The erection of new station buildings, overbridge, &c., at Lidcombe and Flemington is making good progress.

Between Lidcombe and Regent's Park the duplication and regrading work is proceeding. The existing track has been lifted to the new grading, the steel underbridges at Bridge-road and Kerr's-road have been completed, and the Vaughan-street underbridge is approaching completion.

The following table gives particulars of duplication and deviation work completed during the year :—

	Date opened.	Mls. chs.
<i>Suburban Line—</i>		
Auburn to Clyde North (third road) ... ..	10th March, 1924 ... ..	1 0 $\frac{1}{2}$
Flemington to Lidcombe (quadruplication) ... ..	16th June, 1924 ... ..	1 23 $\frac{1}{2}$
<i>Illawarra Line—</i>		
Tempe to Rockdale (quadruplication) ... ..	28th October, 1923 ... ..	2 39
<i>Western Line—</i>		
Middle River to Cox's River ... ..	28th October, 1923 ... ..	4 23 $\frac{1}{2}$
<i>Northern Line—</i>		
Broadmeadow to Woodville Junction (third road) ... ..	20th September, 1923 ... ..	1 46 $\frac{3}{4}$
Woodville Junction to Islington Junction (third road) ... ..	2nd March, 1924 ... ..	0 21 $\frac{1}{2}$
Adamstown to Broadmeadow (fourth road) ... ..	10th March, 1924 ... ..	0 65 $\frac{1}{2}$
Total ... ..	... ..	11 60 $\frac{1}{2}$

Following are particulars of duplications and deviations in hand at the close of the year :—

<i>Suburban Line—</i>	Mls. chs.
Lidcombe to Regent's Park ... ..	2 35 $\frac{3}{4}$
<i>Illawarra Line—</i>	
Rockdale to Hurstville ... ..	2 40 $\frac{1}{2}$
Total ... ..	4 76 $\frac{1}{4}$

#### ELECTRIFICATION OF THE RAILWAYS.

The work in connection with the quadruplication and electrification of the railway line between Sydney and National Park has made further progress during the year. A commencement has been made with the construction of a new eastern platform at Redfern; the erection of a bridge over Cook's River at Tempe has been completed; new carriage sheds under construction at Mortdale and Punchbowl are proceeding. The duplication work from Rockdale to Hurstville is progressing; the earthworks and retaining walls are well in hand and the piers and abutments for an overbridge at Hurstville are about three-parts completed.

The extension of the White Bay power-house is in hand; the foundation for the walls of the switch house are about two-thirds completed, and the western wall of the generator house is partly constructed.

Thirteen miles of 11,000-volt cable has been laid between White Bay and Meek's-road; poles and cross-arms for the 33,000-volt transmission line, Meek's-road to Hurstville, have been erected, and the mains are in course of erection. Rotary converters are on order for the Prince Alfred Park, Meek's-road and Hurstville sub-stations, and orders will shortly be placed for those required for the Sutherland and Waterfall sub-stations.

Practically the whole of the masts have been erected for the trial section from Sydenham to Rockdale, and the overhead wiring is proceeding

DEPARTMENTAL.

## DEPARTMENTAL COAL MINE, LITHGOW.

Further progress has been made with developmental work during the year.

The headframe and the concreting of the downcast shaft have been completed; the permanent pumping plant for drainage purposes and the winding and haulage machinery have been installed; the power-house has been erected and equipped with the necessary machinery, and the auxiliary fan in the upcast shaft placed in operation.

Of the surface equipment the additional temporary screen installed to ensure more efficient cleaning of the coal, is now working; good progress is being made with the installation of the downcast winding engine, gantries for full and empty skips, screening plant, &c.

The output of coal, which has proved satisfactory for locomotive and other purposes, totalled 253,975 tons for the year.

## SLEEPERS.

## SLEEPERS AND BALLAST.

The total number of sleepers used for duplications, deviations, and additional sidings, was 81,323, and for renewals and maintenance purposes 723,042, making a total of 804,365 sleepers for the year. Fifty-seven thousand three hundred and forty-nine cubic yards of ballast were also used for duplications, deviations, &c., and 196,610 cubic yards for renewals and maintenance purposes, or a total of 253,959 cubic yards used during the year.

## RAILWAY CONSTRUCTION.

## CITY AND SUBURBAN ELECTRIC RAILWAY.

The construction work on that short section of the City and Suburban electric railway which has been authorized has proceeded satisfactorily during the year.

The work of diverting the water pipes forming the main water supply for Sydney and the Eastern Suburbs to allow of the extension of the Cleveland street bridge having been completed, the construction of the three additional arches to carry the five new railway tracks on the eastern side of the existing lines has been taken in hand and is making good progress.

The open cut excavations for the northern concourse of the Central station, together with the approach ramps on the eastern and western sides are approaching completion, and the concrete footings for the side wall and column bases are well forward. The eastern retaining wall from Central station to Eddy avenue has been completed and the western retaining wall nearly so.

The footpath arches of the Eddy-avenue bridge on both sides of Eddy-avenue have been finished, and will be open to pedestrian traffic when the work of asphaltting and kerbing now being carried out by the City Council is completed. The excavation for the street piers will then be proceeded with. The masonry-faced retaining wall from Eddy-avenue to Hay-street, facing Elizabeth-street, has been completed, and those from Hay-street to Campbell-street are approaching completion. The masonry-faced reinforced concrete arched bridge over Hay-street has been finished. The construction of a bridge at Campbell-street was in abeyance for a time pending negotiations with the City Council for a wider roadway, but the original design having been decided upon, work proceeded and has made good progress. Work in connection with the foundations for the new building for offices at Campbell and Goulburn streets is in hand.

The Darling Harbour reclamation scheme has been pushed forward, and the driving of the tunnel for a new and enlarged circulating water intake for Ultimo power-house has made satisfactory progress. The reclamation scheme necessitated the provision of a new water intake for the Fresh Food and Ice Company's property, leased by the Company, and this work has been completed.

The driving of the twin tunnels under Liverpool-street, towards Goulburn-street, has been pushed forward, and a length of 350 feet completely lined with concrete. Beyond the finished tunnels the brick side and centre walls have proceeded to within about one chain of the starting-point of the special steel flat top construction to be carried forward towards Goulburn-street.

Satisfactory progress has been made with the construction of the Liverpool-street station. The whole of the side walls and the main arch have been completed, and the entrance and exit subways on the eastern side concreted as far as the concourse platform at each end. The exit subways on the north-western side are also nearing completion. Work is in hand of waterproofing the main arch, the laying in of the brick-in-cement protective coating, and the waterproofing of the walls and arches of the subways.

The driving and lining of the tunnels for the Up and Down City east roads, extending from Liverpool-street to St. James' station is now practically finished; the portion of "Cut and Cover" construction between Bathurst and Park-streets has been completed.

With the exception of the excavation for the subways the whole of the excavation for the St. James' station has been finished, a total quantity of 116,000 cubic yards of material having been removed. The concreting of the main side walls with the necessary waterproofing is approaching completion.

The driving of the three tunnels from St. James' station under Macquarie-street has been pushed forward, and the two main tunnels have now reached a point opposite the Sydney Hospital. The special construction at the junction of the Up City east and Eastern Suburbs roads has been completed, and the concrete arch constructed. Excavation work is now proceeding at the crossover from the Up to the Down City east roads. The concreting of the tunnels is proceeding concurrently with the driving.

The twin tunnel under Park-street, for the Eastern Suburbs railway, has been completed on the southern side, and work is proceeding rapidly on the northern side.

The

The need for improved passenger transport within the metropolitan area has been stressed for a great number of years. The saturation point on existing tracks, both rail and tram, has already been reached, and the transport problems of the city and suburbs must become a matter of very grave concern, even if large sums of money are made available without delay. Failing that, the problems will be impossible of efficient and safe solution.

There is to-day world-wide admission that well-designed electric services are more satisfactory for the swift and safe handling of great numbers of passengers than any other yet evolved. The perfecting of those electric tramway services which exist, together with the early completion of the greater railway services designed and commenced, are now matters of the greatest urgency. Suburban areas have been built upon and peopled as a direct result of the construction of railways and tramways, and people when making homes in these areas naturally anticipated that the transport services would be adequately maintained. These services are to-day the best that can be given under existing conditions, but neither from the public nor the Departmental point of view can they be deemed adequate.

#### RAILWAY CONSTRUCTION GENERALLY.

The construction of the following new lines has been proceeded with during the year :—

	mls.	chrs.
Macksville to Urunga (opened to public traffic on 3rd December, 1923) ... ..	17	20
Glenreagh to Dorrigo ... ..	42	76
Regent's Park to Cabramatta ... ..	5	54
Regent's Park to Enfield Marshalling Yards ... ..	3	18
Gilmore to Kunama (opened to public traffic on 17th December, 1923) ... ..	21	44 $\frac{3}{4}$
Tarana to Oberon (opened to public traffic on 3rd October, 1923) ... ..	15	7
Molong to Dubbo ... ..	80	12
Coonabarabran to Burren Junction (opened to public traffic from Coonabarabran to Gwabegar, 59 mls. 6 $\frac{3}{4}$ chrs., on 10th September, 1923) ... ..	95	28
Binnaway to Werris Creek (opened to public traffic on 29th October, 1923) ... ..	91	52 $\frac{3}{4}$
Sydenham to Botany ... ..	5	16
The Rock to Pulletop ... ..	26	10
Roslyn to Taralga ... ..	15	66
Castle Hill to Rogan's Hill ... ..	...	77
Trida to Menindee ... ..	156	1
Richmond to Kurrajong ... ..	7	0

The section from Macksville to Urunga was completed and opened to public traffic on the 3rd December last. With the exception of the bridge over the Clarence River, this completes the North Coast railway, the construction of which commenced at West Maitland in 1908. The extensions from Gilmore to Kunama, Coonabarabran to Gwabegar (part of the extension from Coonabarabran to Burren Junction), Binnaway to Werris Creek, and Tarana to Oberon have also been completed and opened to public traffic during the year.

The work on the line from Glenreagh to Dorrigo is progressing; the rails are laid to within 4 miles of Dorrigo.

Work is approaching completion on the line from Regent's Park to Cabramatta, and also on the fork connecting the Regent's Park to Enfield marshalling sidings with the Regent's Park to Cabramatta lines.

The large steel bridge over the Macquarie river, near Dubbo, and the steel bridge over the Little river, near Arthurville, have been completed on the extension from Molong to Dubbo. Plate laying has been finished from Molong to within 5 miles of Dubbo, and the erection of the station buildings is now in hand.

Between Sydenham and Botany work is proceeding slowly owing to delay in delivery of steel material. Bridges have been erected over the old Botany-road, Shea's creek, Unwin's Bridge road and the stormwater channel at Marrickville, and the work of erection of a bridge over Botany-road is being proceeded with. The earthworks are now in hand, and have proceeded to near the crossing of the main Illawarra railway line, where preparations are being made for the erection of a 120 feet steel bridge.

On the section from The Rock to Pulletop, plate-laying is about one-half done, and work has proceeded slowly on the earthworks and waterways. Between Roslyn and Taralga the earthworks and waterways are in hand, but no plate-laying has yet been done.

Owing to delays in obtaining possession of the necessary land and final determination of the route to be traversed, the work on the Richmond to Kurrajong extension has not advanced as far as expected; good progress has, however, been made with the earthworks, and the rails have been laid through the town of Richmond. Work between Castle Hill and Rogan's Hill has recently been commenced; the earthworks are practically completed and plate-laying will shortly be taken in hand.

Construction work on the line from Trida to Menindee, which was suspended on the 21st December, 1918, was resumed in March of this year. Plate-laying has been completed for a length of 15 miles.

The permanent staking of the proposed railway lines from Booyong to Ballina, and Castle Hill to Rogan's Hill has been completed; similar work is now in hand from Kyogle to Richmond Gap and Uranquinty towards Moon's siding.

Preliminary trial surveys are in progress from Grafton to Killarney, Cooma to Adaminaby and Cooma to Dalgety. Trial surveys have also been completed from Morpeth to Port Stephens, Stroud Road to Port Stephens, Casino to Bonalbo, Cassilis to Leadville, Tempe to Salt Pan Creek, Salt Pan Creek to East Hills, North Sydney to Manly, and Fairfield to Prospect.

Explorations were made during the year of routes from Maryvale to Gulbong, Casino to Bonalbo, and Grafton to Killarney.

ROLLING-STOCK

## ANNUAL REPORT OF THE COMMISSIONERS.

11

## ROLLING-STOCK.

New rolling-stock has been provided as under :—

	Additions to stock—	Renewals—	Remarks.
<i>Locomotives.—</i>			
“NN” class passenger tender engines .....	4	...	Built in Railway workshops. Built by local contractors.
“K” do goods do .....	30	...	
<i>Coaching Stock—</i>	34	...	
Sleeping cars .....	3	...	} Built in Railway workshops.
Rail motor vehicles .....	4	...	
<i>Goods and Departmental Stock.—</i>	7	...	
Four-wheeled open “U” waggons .....	372	...	} Built by local contractors.
Bogie louvered vans .....	21	...	
Gas vans .....	2	2	Built in Railway workshops.
	395	2	

The cost of additional rolling-stock charged to capital was £557,703, as compared with £605,074 in the previous year, and the amount debited to working expenses on account of replacements, renewals, and repairs of rolling-stock was £2,669,207, as compared with £2,662,209 for the previous year.

## REPAIRS OF ROLLING-STOCK.

The rolling-stock generally has been maintained in good working order during the year.

## LOCOMOTIVES.

The following engines were rebuilt in the workshops (74 at Eveleigh and 10 at Honeysuckle) and fitted with new boilers :—

- 34 Passenger tender engines.
- 9 Passenger tank engines.
- 34 Goods tender engines (including 1 engine on the duplicate stock).
- 7 Goods tank engines.

84

One hundred and one new locomotive boilers were constructed in the Eveleigh shops. Three Hawthorne and Leslie cranes of 7-ton capacity were imported and assembled in the same shops. One tramway motor was rebuilt at Honeysuckle workshops.

One thousand and sixty-six engines, including 20 tramway motors, have had general repairs during the year, 505 at Eveleigh workshops, 68 engines and 20 motors at Honeysuckle shops and the remaining 473 at smaller depôts. Three hundred and eighty engines and 20 tramway motors were heavily repaired, 13 of the engines having been reconstructed and converted to the superheated system; 290 engines underwent medium repairs, and the balance of 376 engines, general repairs of a lighter character.

Five hundred and six locomotive boilers were overhauled at Eveleigh workshops, 63 locomotive boilers and 20 boilers for tramway motors at Honeysuckle shops, and 454 locomotive boilers at smaller depôts, making a total of 1,043 boilers passed through the workshops during the year. Three hundred of the boilers, including 19 for tramway motors, were internally examined, heavily repaired, refilled with tubes, and returned to locomotives, 248 of them being dealt with at Eveleigh, 47 at Honeysuckle, and 5 at smaller depôts.

Thirty goods engines of the “K” class were delivered by the Clyde Engineering Company Limited on account of their contract for 75. Eight “T” class boilers were also delivered by the same company, as part of their contract for 10 boilers.

Four passenger tender engines of the “NN” class were built in the Eveleigh workshops.

## COACHING STOCK.

Four thousand five hundred and eighty-one carriages were generally repaired during the year, 3,639 at Eveleigh, 8 at Clyde, 2 at Enfield, and 932 at the Honeysuckle workshops; 234 of the vehicles were heavily repaired.

Four rail motors and 3 “TAM” type sleeping cars were constructed in the Eveleigh workshops.

## GOODS STOCK.

Forty-four thousand and ninety-four wagons and vans passed through the workshops, of which one was rebuilt, and 2,295 were heavily repaired. Fourteen thousand five hundred and seventy-six received attention at Clyde repair siding, 6,829 at Enfield, 2,112 at Flemington, 13,738 at White Bay, 1,070 at Eveleigh workshops, and 5,769 at Honeysuckle. Twenty-seven “U” wagons were fitted with tanks to carry water.

Fifty-eight goods stock vehicles were heavily repaired by contractors, Messrs. Ritchie Bros. Limited, and Tulloch's Limited.

Three

Three hundred and seventy-two "U" wagons and 21 bogie louvered vans were delivered by contractors, and 2 gas vehicles were constructed in the Eveleigh workshops as additional capital stock; 2 gas trucks as replacements of condemned vehicles were also constructed in the Eveleigh workshops.

#### REPAIRS OF PLANT AND EQUIPMENT GENERALLY.

Sixty-three stationary boilers were overhauled and 46 of them received heavy repairs. One new boiler and 2 repaired locomotive boilers were fitted to the existing plant as replacements, one at Waterfall, one at blacksmith's shop, Eveleigh, and one at the rolling mill furnace, Clyde repair siding; four new boilers were fitted to additional plant, one to Ruston Hornsby steam navvy, 2 to washout plant, Broadmeadow, and 1 in round house, Lithgow.

Oil engines were fitted to pumping plants at Gwabegar and Nambucca Heads.

#### OTHER ADDITIONS AND IMPROVEMENTS.

Additional machinery and plant have been installed as follow :—

##### EVELEIGH WORKSHOPS.

*Locomotive Shops*.—Two trolleys for transporting boilers, 2 portable facing machines for boiler seatings, 4 1-ton jib cranes in foundry, 2 35-ton four motor overhead travelling cranes, 1 electrically driven planing machine 8 ft. x 4 ft. x 4 ft., 1 "Landis" 4-in. bolt threading machine, file-cutting equipment, 1 guillotine plate-shearing machine, 1 "Buda" electric truck and battery beard, 1 portable cylinder boring machine with air-motor drive, 2 steam chest boring machines with air-motor drive, dust removing plant in tool-room, 1 portable cylinder valve seat facing machine with air-motor drive, 1 portable firebox seating facing machine with air-motor drive, 1 No. 3 Wadsworth core box-making machine, and 2 Wadsworth jar jam roll-over lifting core machines, small jib crane over Pridmore moulding machine, stairs and crane in pattern shop, sand blast equipment, 2 Hawthorne Leslie tank engines and cranes combined, improved tool posts to 42 lathes, 1 portable crank axle turning machine with air-motor drive, 1 hydraulic press machine with pump, 1 "Tabor" 30-inch power roll-over draft moulding machine, 1 drop testing machine with hydraulic hoist for testing axles, ground traverser for large erecting shop, 1 5-ton electrically driven overhead travelling crane, 1 66-inch heavy duty wheel lathe and 40 h.p. and 7½ h.p. motors, 2 motor generator equipments for electrical welding, 2 machines for cutting burrs from articles made at Ajax forging machine.

*Carriage and Wagon Shops*.—One electric hoist and runway, dust removing plant, 1 4-foot vertical boring and turning mill, and 1 motor generator equipment for electrical welding.

##### EVELEIGH LABORATORY.

One 20-inch Vanguard drilling machine, one double-ended heavy-type emery grinder with extended spindle, one No. 1 "Sterling" hack saw, one No. 0 back-geared power-feed "Steptoe" horizontal milling machine, shafting, belting, pulleys, &c., for driving machinery, one "Denham" gap bed lathe, one "Elverson" type Oscilloscope for testing high speed engines.

##### CLYDE REPAIR SIDING.

Furnaces and tanks for the 1½-inch Ajax forging machine, 1-inch water service to eight smiths fires, and two furnaces, one "Phoenix" electric lifting magnet and turbine generator fitted to Harmon steam crane, one automatic cross-cut saw-bench, type MMM No. 1 size, one 4-foot vertical boring and turning mill, one electric welding machine, one 5-cwt. steam hammer, and one punching and shearing machine.

##### HONEYSUCKLE WORKSHOPS.

Fourteen "Dilo" locomotive wheel-weighing machines, one "Pearn Richards" No. 2 horizontal combined surfacing, boring, milling, drilling and tapping machine, two 6¼-inch centre screw-cutting self-acting, sliding and surfacing lathes, one quartering machine for dealing with wheels up to 7 feet 6 inches diameter, one tyre boring and turning machine, one 10-inch centre 9-foot gap bed high-speed, self acting sliding, surfacing and screw-cutting lathe, one 12¼-inch sliding, surfacing and screw-cutting lathe, one 4-ton petrol lorry, and one Hawthorne Leslie tank engine and crane combined.

##### GENERAL.

Gassing facilities at new horse dock, Alexandria; oxy-welding plants at Thirroul, Picton, Cowra Cootamundra, Valley Heights, Lithgow, Parkes, Wellington and Hornsby; one portable boiler seating facing machine with air motor drive, one 1½-ton Morris truck (electric battery) and Lamson pneumatic tube system at running shed, Enfield; Lamson pneumatic tube system and one air compressor at running shed, Eveleigh; one portable boiler seating facing machine with air motor drive at Goulburn, Bathurst and Lismore; one air-compressor at South Goulburn; one "Gardner" air-compressor, one 15 horse-power motor and one 7½ horse-power motor, one "Headstrom" shaping machine at Temora; one 8½-inch centre gap bed lathe at Lithgow; one 8½-cwt. steam hammer at Bathurst; and one punch and shearing machine at Broadmeadow.

Additions and improvements to the locomotive water supplies have been made at Sydney, Enfield, Goulburn, Fish River, Temora, Batlow, Penrith, Mt. Victoria, Lithgow, Wallerawang, Gwabegar, Newnes Junction, Euabalong, Molong, Taree, Glenreagh, Caroon, Binnaway, Kootingal, Armidale and Burringbar.

##### STORES BRANCH.

The value of the stock of stores at the 30th June, 1924, as per certificate of Comptroller of Stores (see page 23), was £1,614,186 15s. 3d., inclusive of £139,977 5s. 5d. for tramways, being a decrease of £81,389 19s. 10d., as compared with the value of the stock on the 30th June, 1923.

#### RESULTS.

## ANNUAL REPORT OF THE COMMISSIONERS.

13

RESULTS OF THE WORKING.  
RAILWAYS.

YEAR ended 30th June, 1924, compared with 1923, 1907, and 1888.

PARTICULARS.	Year ended 30th June.			
	1924.	1923.	1907.	1888.

## TRAMWAYS.

During the year the following extensions were opened to traffic, viz.:

Date opened.	Mls. Chs.	Track.
20th November, 1923—Connection between Chatswood and Mosman Lines at Falcon and Mil'ers streets ... ..	— 5	Double.
3rd December, „ —Tudor-street to Ivy-street, Newcastle, via Maitland-road ... ..	— 43	„
17th „ „ —Scott-street to Crown-street, Newcastle, via Telford and Hunter streets ... ..	— 49	„
„ „ „ —Military road to Bradley's Head road via King Max street ... ..	— 10 $\frac{1}{4}$	„
22nd January, 1924—Lilyfield (Piper-street to Brennan-street)...	— 7 $\frac{1}{2}$	„
18th February, „ —Undercliffe to Earlwood ... ..	1 19 $\frac{1}{4}$	Single.

The number of miles of line open for traffic on the 30th June, 1924, was 227 $\frac{3}{4}$ . (See Appendix XXVIII.)

The expenditure charged to Capital Account during the year was £783,927. (See Appendix XXX.)

The total capital expenditure on lines open to traffic on 30th June, 1924, was £10,758,958. (See Appendix XXIX.)

The total earnings amounted to £3,633,916 as compared with £3,598,114 last year, being an increase of £35,802 or 1 per cent.

The working expenses amounted to £3,091,531 as compared with £3,092,306 in the previous year, or a decrease of £775, and are equal to 85.07 per cent. of the earnings.

Although the operating ratio in the current year is .87 per cent. less than the previous year the following charges beyond the control of the Administration, were added to the working costs:—

Increased payments in wages and salaries consequent on the determination of the New South Wales Board of Trade, dated 7th September 1923, given effect to from 30th September, 1923, to certain staff and from 12th October 1923 to the remainder of Staff, in respect of the basic wage, and pro rata increases to members of the staff already paid at higher rates than the basic wage ... ..	£ 28,500
Increased payments in wages and salaries under awards of the Commonwealth Court of Conciliation and Arbitration and of the State Court of Industrial Arbitration issued during the year, and awards of the previous year not operative during the whole of that year ... ..	107,543
Automatic increases due to awards of the Commonwealth Court of Conciliation and Arbitration and of the State Court of Industrial Arbitration and advances in pay approved by the Commissioners to equalise conditions created by awards...	15,682
<i>Less:</i>	151,725
Saving due to the restoration of the working week to 48 hours ... ..	100,304
	£51,421

## TRAMWAY FARES.

The withdrawal of the additional fare of 1d. from the 11th February, 1923, on each ticket issued on Sundays, Xmas day and Good Friday caused a further loss of revenue, as compared with the previous year, of £56,000.

## ACCOMMODATION FOR TRAFFIC AND CONDITION OF THE LINES AND ROLLING-STOCK.

The permanent way, buildings, rolling-stock, machinery and plant have been maintained in good working condition.

A length of 13 miles 27 chains of track has been relaid, 1 mile 43 chains duplicated, and a number of curves renewed. To facilitate traffic a connection has been put in between Long siding, Moore Park, and the main Coogee line and several cross-overs constructed at various places.

The work of reconstruction of Botany-road has been undertaken in conjunction with the Botany-road Trust and good progress made with the work so far as it affects alterations to levels within the tramway area between Boundary-street and Wilson-street, a length of 4 miles 40 chains. The work of concreting and woodpaving the Council's area in Botany-road, between Cleveland-street and Boundary-street, which is being carried out by the Department, is now proceeding. Alterations have also been made to the level of the track to accord with new road construction carried out by the local Councils at North Sydney, Willoughby, Longueville and Watson's Bay.

During the year 75,618 tons of metal were used in the maintenance of tramway tracks, and 114,947 square yards of wood paved track and 271,385 square yards of macadamised track were top-dressed with tar, making a total area of 386,332 square yards so dealt with.

Twenty-six miles of corrugated rails were treated by the Woods-Gilbert rail grinding machine, and a mile and a half of corrugated rails were treated by the Celerity and Reciprocating grinding machines.

The work of electrically building up crossings and rails *in situ* has been successfully carried on, 2,579 crossings having been built up at an average cost of 16s. 10d. each, and 53,275 feet of rails built up at an average cost of 2s. 1d. per foot. As the value of a standard crossing is £40, it will be seen that a large saving in maintenance has been effected by the building-up process.

The

## ANNUAL REPORT OF THE COMMISSIONERS.

17

The Sandberg *in situ* process of rail hardening has been brought into operation with a view to lengthening the life of the rails; the tracks in George, Pitt, and Castlereagh streets have already been treated, while the tracks in Newtown-road are now being done. It is anticipated that the life of the rails will be considerably extended by this process.

Further extensions have been made with the use of power appliances in permanent way construction work by the addition of four electrical hoists, one electrically driven jib crane, and five electrically driven batch concrete mixers. The plant has also been increased by the addition of three steam lorries, the provision of which has permitted of more expeditious handling of materials.

At the Tar distillery, Woolli Creek depôt, 128,902 gallons of tar were treated, producing 81,594 gallons of distilled tar and 22,494 gallons of pitch; in addition 23,665 gallons of tar oils have been extracted and the following by-products manufactured:—

Fluid disinfectant	...	...	...	...	...	...	...	17,874 gallons.
Rail paint	...	...	...	...	...	...	...	2,273 „
Wood preserving oil	...	...	...	...	...	...	...	2,953 „
Enamel paints	...	...	...	...	...	...	...	5,378 „

Owing to the restricted supply of crude tar, the Tar Still worked much below its full capacity, and as a consequence the output was considerably decreased. The estimated saving in the year by the manufacture of the by-products as compared with current market rates amounted to £1,600.

The overbridge at Randwick racecourse has been extended and additional barriers and facilities provided for the speedy handling of the racecourse traffic. The structural work of the Ultimo switch-house is nearly complete. Two waiting sheds, a meal room, and a room to be used for Institute purposes at Fort Macquarie have been erected; improvements have been made to several buildings used for Institute purposes, and a number of other buildings, including car sheds, waiting sheds, meal rooms, starters' boxes, sub-stations, &c., have been painted or renovated.

## NEWCASTLE ELECTRIFICATION.

In connection with the electrification of the Newcastle tramways, the deviation of and other necessary work on the Mayfield line has been completed and the line opened for electric traction on 17th December. A new sub-station has been provided at Hunter street and the two 1,000 k.w. rotary converters remote controlled from the Zarra-street power-house will be in operation shortly. One 1,000 k.w. rotary converter has been installed at Hamilton sub-station, a similar one at Zarra-street power-house, and a large storage battery at Carrington sub-station. The first extension of the car shed covering three tracks and paint shop has been practically finished, and the second extension covering six tracks and repair shop is well in hand. Good progress has been made on the extension of the workshops and traverser track, as well as with the erection of offices for the Electrical branch; a drivers' instruction room has also been provided. Wood-blocking of the track in Scott-street, from Watt-street to Brown-street, was also undertaken and completed during the year.

## ROLLING-STOCK.

One hundred and fifty-three new P type cars have been constructed and put into service; 25 were completely built in the Randwick workshops, and 128 built by contract. The latter were electrically equipped at the Randwick workshops.

Eighteen L type cars have been converted at Randwick to LP type for service at Newcastle, and 1 new steam motor, charged to Working Expenses, manufactured at Randwick and put into service.

Five hundred and seven electric cars and 303 electric car trucks were overhauled and generally repaired, of which 337 of the cars were repainted. One thousand five hundred and thirty-one armatures were rewound, and 3,788 received minor repairs.

Sixty-one steam motors received a general overhaul in the Randwick workshops, 136 have received repairs of a less extensive character, and 40 were either repainted or varnished. Sixty-two steam cars have been overhauled and repainted or varnished, and 17 road motor vehicles have been overhauled, of which 8 were repainted or varnished.

## RANDWICK WORKSHOPS.

Further additions have been made in the number of dies for drop forgings and pressed steel-work as well as fixtures, jigs, gauges, and tools. Several of the existing machines have been improved and modernised.

Additional machinery and equipment have been installed, as follow:—Lumsden No. 1 oscillating tool grinder, Gray's sheet-metal cutter, exhaust fan, double spindle drilling machine, cable stripping machine, and two portable spray lacquering machines.

## POWER-HOUSES.

The building for the new switch-house at Ultimo to accommodate the whole of the high-tension switchgear for this power-house, is nearing completion; a large amount of switchgear has been delivered, and will be erected in the course of next year. Owing to the filling up of Darling Harbour by the spoil from the City railway, new circulating water conduits—the work on which is about one-half finished—are being provided. The construction of an 18,750 k.w. 6,600-volt 25-cycle turbo alternator for White Bay by local contract has made satisfactory progress, and a commencement has been made with the assembling of the plant at the power-house. The construction of a second similar unit, also by local contract, is now in hand. Eight water-tube boilers supplied by contract for the units are being erected at the power-house, together with coal and ash-conveying plant. The extension of the White Bay power-house is well in hand, and the main buildings have been erected to the roof principals level. Two 22,000 k.w. 11,000-volt 50-cycle turbo alternators for White Bay are in course of manufacture, and a commencement has been made to assemble the first machine in the power-house.

The

The extension of the turbine room at the Zarra-street power-house has been completed and an additional 7,500 k.w. 11,000-volt 50-cycle turbo alternator has been erected and will be shortly put into service. Work on the extension of the power-house building is proceeding satisfactorily.

The electric output from White Bay and Ultimo power-houses for the year was 154,447,350 kilowatt-hours, comprising 75,546,390 kilowatt-hours at Ultimo and 78,900,960 kilowatt-hours at White Bay. Of the current generated at Ultimo, 63,828,839 kilowatt-hours was the output of the 6,600-volt 25-cycle plant, 11,641,770 of the 50-cycle plant, and 75,781 kilowatt-hours of the direct current plant.

The energy supplied to the City Council was 20,108,233 kilowatt-hours, including 3,172,983 kilowatt-hours from the 50-cycle plant at Ultimo. This shows an increase on last year's supply of 7,378,304 kilowatt-hours.

Energy from the 11,000-volt 50-cycle supply has again considerably increased, being 8,364,939 kilowatt-hours as compared with 3,022,877 kilowatt-hours for the previous year. Supply of current to the Bankstown Municipality commenced during the year.

The output of the Zarra-street power-house aggregated 28,969,176 kilowatt-hours, as compared with 23,694,149 kilowatt-hours in the previous year. Of the total power generated for the year 22,985,696 kilowatt-hours were supplied to outside bodies as follows:—Newcastle City Council 19,353,908 kilowatt-hours, Government Dockyard, Walsh Island, 1,562,350 kilowatt-hours, West Maitland Municipal Council 552,691 kilowatt-hours, Tarro Shire Council 53,769 kilowatt-hours, Singleton Municipal Council 222,270 kilowatt-hours, Broken Hill Proprietary Company, Limited, 912,045 kilowatt-hours, and Newcastle Coal Company, Greta, 328,663 kilowatt-hours, the balance 5,983,480 kilowatt-hours being used for the requirements of the Department.

#### SUB-STATIONS.

The new sub-station at Rose Bay, referred to in our last report, has been completed and brought into service. A new sub-station at Forest Lodge is in course of erection and will shortly be brought into operation; a sub-station at Chullora and switch-house at Rozelle were constructed during the year; a small temporary sub-station has been installed at Meek's road, a large storage battery put into service at Mosman, and additional transformer plant installed at Central sub-station and White Bay steel works.

Narrabeen sub-station has been converted to the remote control system, and Ryde sub-station will be automatically controlled at an early date; including these the number of smaller sub-stations under remote control will be eight.

#### OVERHEAD CONSTRUCTION AND FEEDER SYSTEM.

In the Metropolitan and Newcastle areas the overhead systems generally have been efficiently maintained during the year. One mile 28 chains of trolley wire has been erected on new lines, and 61 chains on duplication of existing lines; 13 miles 16 chains of trolley wiring have been altered on account of tram tracks having been relaid; 7 miles 60 chains of high tension transmission lines (2,200 volt) have been erected in connection with lighting and signalling at Lidcombe to Regent's Park, Enfield South to Punchbowl, sub-station to boiler shop, Chullora, and from Port Waratah to Hamilton; 6 miles of high tension transmission lines (11,000 volt) have been laid underground at Newcastle; 16 miles 20 chains of high tension cables (2,200 volt) have been laid in wooden boxing on pegs for signalling, Flemington to Granville, Meek's road to Rockdale, Enfield South to Bankstown, Canterbury to Belmore Junction, Newtown to Petersham; 40 chains of high tension cables (6,600 volt) have been laid underground between the transformer house and the Eveleigh foundry; 18 miles 12 chains of low tension overhead cables have been erected, of which a length of 7 miles 52 chains was at Newcastle; 42 chains of low tension cables and 4 miles 10 chains of low tension control cables have been laid underground at Newcastle; 27 miles 27 chains of trolley wire have been renewed.

On the telegraph and telephone system 21 miles of copper wire have been erected, and 10 miles of lead-covered cable have been laid in the Metropolitan district, and 6 miles of lead-covered cable have been laid in the Newcastle district; 84 miles of aerial wire were dismantled and circuits placed in lead-covered cables in the Sydney district; 109 defective poles have been replaced and 200 poles removed from railway lines.

A commencement has been made with the construction of the 33,000-volt transmission line from Hamilton to Cockle Creek for supply of electricity in bulk to consumers in the adjacent districts.

#### TESTING LABORATORY.

The volume and diversity of work performed in the Laboratory has steadily increased during the year.

The new apparatus which has been installed includes sub-standards for the measurement of current, voltage and power. Standard instruments are coming forward for the measurement of resistance, capacity, and inductance, and also a three-element oscillograph.

Insulator testing has become very important, in view of the great development of the Department as a power supplier, and therefore provision is being made for the installation of high-tension testing transformers, with pressures ranging to 300,000 volts.

An extensive series of tests has been made to determine the characteristics of various traction motors supplied to the department, and valuable information has been obtained.

Comprehensive investigations regarding the properties and filtration of transformer oils and of condenser tube corrosion were made and reports prepared.

During the year many important electrical, physical and metallographic investigations have been made for the department and other bodies.

#### TRAMWAY CONSTRUCTION.

The permanent staking of the deviation of the proposed line from Zetland to Rosebery has been completed.

Trial surveys have also been completed for proposed tramway lines from Manly to Castle Rock, and Rockdale to Bexley.

#### RESULTS

## ANNUAL REPORT OF THE COMMISSIONERS.

## RESULTS OF THE WORKING.

## TRAMWAYS—ALL LINES.

Year ended 30th June, 1924, compared with 1923, 1907, and 1888.

PARTICULARS.	Year ended 30 June—			
	1924.	1923.	1907.	1888.
Amount expended on construction and equipment ...	*£10,758,958	£9,975,031	£3,669,524	£877,244
Cost per mile open (including Workshops and Rolling-stock) ... ..	£47,275	£44,352	£28,518	£22,786
Total miles open for traffic ... ..	227½	225	128¾	38½
Average miles open for the year ... ..	226½	227½	127¼	38
Earnings ... ..	£3,633,916	£3,598,114	£908,701	£236,519
Working expenses ... ..	£3,091,531	£3,092,306	£727,947	£219,196
<b>BALANCE</b> (after paying Working Expenses) ...	<b>£542,385</b>	<b>£505,808</b>	<b>£180,754</b>	<b>£17,323</b>
<b>PERCENTAGE OF PROFIT TO CAPITAL INVESTED</b> ... ..	£ s. d. 5 4 8	£ s. d. 5 3 10	£ s. d. 4 18 8	£ s. d. 1 19 7
<b>PERCENTAGE OF WORKING EXPENSES TO EARNINGS</b> ... ..	<b>85'07</b>	<b>85'94</b>	<b>80'11</b>	<b>92'67</b>
Earnings per average mile open ... ..	£16,070	£15,815	£7,141	£6,224
Working expenses per average mile open ... ..	£13,671	£13,592	£5,721	£5,768
<b>RETURN PER AVERAGE MILE OPEN</b> (after paying Working Expenses) ... ..	<b>£2,399</b>	<b>£2,223</b>	<b>£1,420</b>	<b>£456</b>
Earnings per tram mile ... ..	s. d. 2 3	s. d. 2 4¾	s. d. 1 1	s. d. 3 4¾
Working expenses per tram mile ... ..	1 11	2 0¾	0 10½	3 1¾
<b>RETURN PER TRAM MILE</b> (after paying Working Expenses) ... ..	<b>4</b>	<b>4</b>	<b>2½</b>	<b>3</b>
Number of passengers carried ... ..	340,957,725	331,001,822	155,017,982	Not obtainable.
Tram mileage... ..	32,110,054	30,071,022	16,620,434	1,388,786

\*£17,455 of this sum was paid from the Consolidated Revenue, and no interest is payable thereon.

Further information regarding the working of the various sections will be found as an Appendix, pages 54 to 57.

RAILWAYS

## RAILWAYS AND TRAMWAYS.

The total number of staff employed on 30th June, 1924, not including those engaged in the construction of new lines of railway and tramway, was 49,461, and the average number actually at work throughout the year, 47,786—Railways, 37,753; Tramways, 10,033—as compared with 36,282 and 9,788 respectively for the previous year, or a total increase of 1,716 for the year ended on 30th June last. The staff employed on railway and tramway construction works number 2,747.

In consequence of the determination by the New South Wales Board of Trade, dated 7th September, 1923, by which the minimum male adult wage was raised from 13s. 2d. to 13s. 8d. per day, variations of the awards of the State Industrial Arbitration Court were made providing for an increase in the pay of adult male workers of 6d. per day, and *pro rata* increases in the rates of junior employees. The increase in the expenditure on this account is at the rate of £343,250 per annum for all employees engaged on both Capital and Working Expenses accounts, the amount on Working Expenses account being £279,000.

It has to be recorded that for the first time a Federal Award has been made fixing the rates of pay and conditions of a section of the employees. Many years ago an interpretation of the Federal Constitution by the High Court of Australia precluded employees of a State Government from the Commonwealth Court of Conciliation and Arbitration, but some two years ago this decision was reversed by the High Court, and the way was then made open for the Unions to approach the Commonwealth Court of Arbitration. Advantage has been taken of this decision by the Unions, and during the year awards were made by the Federal Court to cover the rates of pay and conditions of employment of the wages staff in the Tramway Traffic branch and in the electrical trades of both services. The net result of these two awards is to increase the expenditure at the rate of £86,970 per annum. Claims are now before the Federal Court on behalf of many other sections of the employees.

The following table shows the successive alterations in the male adult living wage as determined by the State Industrial Arbitration Court, or by the New South Wales Board of Trade:—

	s.	d.
1st January, 1911 ... ..	7	0 per day.
1st January, 1912 ... ..	7	6 „
18th April, 1912 ... ..	8	0 „
1st December, 1915 ... ..	8	9 „
1st September, 1916 ... ..	9	3 „
1st October, 1918 ... ..	10	0 „
8th October, 1919 ... ..	12	10 „
8th October, 1920 ... ..	14	2 „
8th October, 1921 ... ..	15	8 „

(The reduction to 13s. 8d. per day took effect as from 2nd December, 1921, for certain sections of the Service, and at later dates for other sections of the Service.)

	s.	d.
12th May, 1922 ... ..	13	0 per day.

(The first reduction to 13s. per day took effect as from 28th July, 1922, and other reductions were made from various later dates.)

	s.	d.
10th April, 1923 ... ..	13	2 per day.

(Took effect from 18th May, 1923.)

	s.	d.
7th September, 1923... ..	13	8 per day.

(Took effect from 30th September, 1923, for certain sections of the Service, and from 12th October, 1923, for the remaining sections of the Service.)

	s.	d.
7th March, 1924 ... ..	13	8 per day.

RAILWAY

## RAILWAY AND TRAMWAY INSTITUTE.

The membership of the Institute increased to 23,733 during the year; of whom 8,246 are attached to the metropolitan institution, 7,851 to branches at country centres, 3,206 to branches at tramway depots, and 4,430 to sectional libraries established at centres of employment at a distance from headquarters or any of the branch institutes. The expenditure for the year was £48,763, and the revenue from members' subscriptions and other sources amounted to £16,863.

New buildings for institute purposes were erected at Harden, Temora, Singleton, and Murrurundi, and further sectional libraries were opened at South Grafton, Binnaway, Gosford, Trida-Menindee extension, and Zarra-street power-house. There are now forty-four branches and thirty-four sectional libraries.

The number of apprentices being trained at the trades classes and supplementary workshops has continued to increase necessitating additional machinery and equipment being provided. A greater quantity and variety of work has been turned out. The results of the annual examinations show a marked advancement in comparison with the previous year. An electric arc-welding class has been added to that of the oxy-acetylene class, and suitable equipment for practical demonstration has been installed in the supplementary workshops.

Classes in technical and general subjects, conducted by correspondence, have proved of great advantage to employees in isolated country centres; the number of students receiving instruction by this method being 2,348. A matriculation class for students aspiring to a University course has been introduced and is making satisfactory progress. The further facilities for instruction to the staff by means of the locomotive instruction car, and the railway safe-working car, and by a series of moving pictures have been continued with good results.

The library now contains 76,871 volumes, and its usefulness has been extended by the establishment of sectional libraries at a number of offices, stations, construction camps, &c.

## SUGGESTIONS AND INVENTIONS.

The number of suggestions received by the Suggestions, Inventions, and Economies Board during the year was 6,208, as compared with 6,446 of the previous year, a decrease of 238.

Actually an increased number of technical suggestions has been received, the reduced grand total being due to the decreased scope for suggestions relative to the various forms and books used on account of the numerous improvements and economies that have already been introduced.

Of the suggestions received, 853 were adopted, representing an annual saving of approximately £31,700. The total cumulative savings since the inception of the scheme amounts to over £500,000. Of the devices adopted during the year the more important are: A method of welding copper plates; special tools for the manufacture of rail anchors; a cutter for lead-covered cable; an improved type of spiral spring for Morse instruments, &c.; a new type of glazing bar for roofs; the copper-plating of wall and crown stays of locomotives; a device for narrowing the "W" guards of trucks; a device for the manufacture of meat pies for the refreshment room branch; an improved water boiler for refreshment room purposes; a device for bending bus bars, and a method of reconditioning worn triple valves by broaching. Other suggestions adopted have reference to the lay-outs of station yards, additional safe-working appliances, the introduction of safety-guards on machinery, and improvements generally in railway and tramway operation. A satisfactory feature of the suggestions and inventions submitted is the excellence of the sketches and models accompanying same.

## RAILWAY AND TRAMWAY AMBULANCE CORPS.

Sustained interest in ambulance work has been displayed by the staff generally. Instructional classes held at various centres in the metropolitan and country districts were well attended, and a high standard of efficiency in first-aid work well maintained.

Ambulance appliances, which are widely distributed throughout the lines and in the brake vans of through passenger and mixed trains, consist of 652 ambulance boxes, 327 first-aid chests, 20 surgeons' boxes, 2 surgeons' chests, and 720 stretchers.

## "SAFETY FIRST."

The work of educating the staff, the travelling public, and school children in the principle of "Safety First" has continued without abatement. Every effort is made by literary and other means to keep before the employees of the Railway and Tramway services the importance of this movement. Representatives of "Safety First" are to be found in a very large number of centres through the system.

An advisory committee, consisting of representatives from various branches, meets at frequent intervals during the year.

GOVERNMENT

## GOVERNMENT RAILWAYS SUPERANNUATION ACCOUNT.

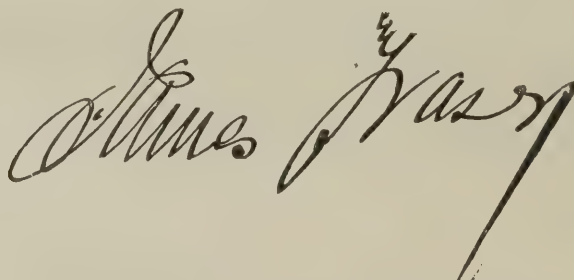

The contributors to the above Account at 30th June, 1924, numbered	...	42,412
Number of employees retired from active service and placed on pension during the year	...	335
Total number of pensioners on Fund at 30th June, 1924	...	2,640
		£ s. d.
Paid in pensions during the year...	...	188,530 18 0
Paid in pensions since inception of Fund on 1st October, 1910	...	1,361,951 13 0
Subsidy from Consolidated Revenue to 30th June, 1924	...	185,850 0 0
Cash Balance at 30th June, 1924	...	1,843 11 6

We desire to place on record our appreciation of the good work done by the staff as a whole, especially by those who have by care, thought and suggestion helped to minimise expenditure and improve the working generally.

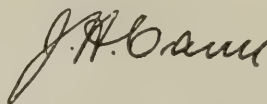

We have the honor to be,

Sir,

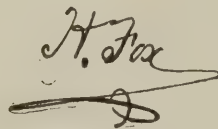

Your most obedient servants,

Chief Railway Commissioner.

Assistant Railway Commissioner.

Assistant Railway Commissioner.

## RAILWAYS.

Chief Mechanical Engineer's Office, Eveleigh,

Sir,

Sydney, 14th July, 1924.

I HAVE to report for the information of the Commissioners, that the rolling-stock, pumping plant, machinery and water supplies of the railways have been maintained in good working order during the year ended 30th June, 1924.

E. E. LUCY,

Chief Mechanical Engineer.

The Secretary to the Railway Commissioners.

Office of Engineer-in-Chief for Existing Lines,

Sir,

Sydney, 23rd July, 1924.

I HEREBY CERTIFY that the permanent way, bridges, buildings, fences, wharves, and other works have been maintained in good order during the past twelve months.

R. L. RANKEN,

Engineer-in-Chief for Existing Lines.

The Secretary to the Railway Commissioners.

Comptroller of Stores Office,

Newtown, 25th July, 1924.

## CERTIFICATE RESPECTING STORES.

I HEREBY CERTIFY that the stock of Stores has been carefully and systematically inspected during the year, and that its value, as shown by the Stores Ledgers at 30th June, 1924, was £1,614,186 15s. 3d. (Railways, £1,474,209 9s. 10d.; Tramways, £139,977 5s. 5d.)

F. C. GARSIDE,

Comptroller of Stores.

The Secretary to the Railway Commissioners.

## TRAMWAYS.

Office of the Chief Electrical Engineer,

Sir,

Sydney, 14th July, 1924.

I CERTIFY that the power-houses, electric plant, tramway rolling-stock, and workshops of the electrical branch of the railways and tramways have been maintained in good working order and repair during the past twelve months.

O. W. BRAIN,

Chief Electrical Engineer.

Office of the Engineer for Tramways,

Sir,

Sydney, 14th July, 1924.

I HAVE to report for the information of the Commissioners, that the permanent way, buildings and other works under my charge, have been maintained in good working condition during the past twelve months.

G. R. COWDERY,

Engineer for Tramways

## APPENDIX VIII—continued.

STATEMENT showing the Capital Cost of the various sections of the Railways on the 30th June, 1924.

Lines opened for Traffic.	Length.	Total Cost.	Average Cost per Mile.
	m. ch.	£	£
Werris Creek to Narrabri West .....	96 2½	655,101	6,802
Narrabri Junction to Inverell .....	158 7¼	520,564	3,308
Narrabri West to Walgett .....	106 9	331,225	3,121
Moree to Mungindi .....	77 13½	367,450	4,762
Burren Junction to Pokataroo .....	42 43	106,612	2,506
West Tamworth to Barraba .....	61 38½	258,413	4,203
Murwillumbah to Grafton .....	149 9	1,418,551	9,513
Casino to Kyogle .....	17 7¼	90,147	5,099
Tarrawingee Tramway .....	39 41	34,243	867
Total mileage and cost .....	5,522 64¼	72,521,577	13,182
Rolling-stock .....	16,244,199		
Machinery .....	1,675,585		
Workshops .....	1,340,660		
Furniture .....	10,146		
Store Advance Account .....	1,563,000		
Total and average cost, all charges .....	5,522 64¼	93,355,167	16,904

## APPENDIX IX.

STATEMENT of Train, Locomotive, and Vehicle Mileage.

Particulars.	Year ended 30th June.	
	1924.	1923.
TRAFFIC TRAIN MILEAGE—		
Passenger—		
Country—Ordinary .....	6,492,758	6,199,067
Assistant .....	305,827	307,182
Light .....	181,756	175,024
Suburban .....	4,842,023	4,574,790
Total .....	11,822,364	11,256,063
Goods—		
Ordinary .....	8,673,236	7,482,406
Assistant .....	633,614	512,586
Light .....	850,747	743,731
Total .....	10,197,627	8,738,523
Mixed—		
Ordinary .....	1,652,183	1,662,533
Assistant .....	14,674	17,151
Light .....	20,140	19,591
Total .....	1,686,997	1,699,275
Total Traffic Train Miles .....	23,706,988	21,693,861
DEPARTMENTAL MILEAGE—		
Light .....	435,915	412,350
Ballast .....	280,659	309,766
Inspection, Special .....	35,859	37,869
Water .....	90,181	86,868
Loco., Coal .....	373,625	307,957
Casualty and Doubling .....	40,534	42,309
Total .....	1,256,773	1,197,119
Shunting .....	4,036,556	3,776,474
Total Locomotive Mileage .....	29,000,317	26,667,454
VEHICLE MILEAGE—		
Passenger—		
Country .....	48,879,642	46,451,250
Suburban .....	37,544,240	36,152,524
Total .....	86,423,882	82,603,774
Goods—		
Loaded .....	185,777,735	169,612,069
Empty .....	100,379,557	89,267,066
Total .....	286,157,292	258,879,135
Total Vehicle Mileage .....	372,581,174	341,482,909
GROSS TON MILEAGE—		
Passenger Trains .....	2,059,462,171	1,959,147,700
Mixed Trains .....	331,201,976	339,495,646
Goods Trains .....	3,706,029,963	3,212,697,614
Departmental Trains .....	57,535,381	62,909,822
Total .....	6,154,229,491	5,574,240,842

## 33

## APPENDIX X.

RAILWAYS.—STATEMENT SHOWING LOCOMOTIVES, COACHING STOCK, GOODS STOCK, AND SERVICE STOCK ON THE BOOKS AT 30TH JUNE, 1924.

Vehicles.		Tractive Power.		Vehicles.		Capacity.		
Number.	Total.	Average per Loco.	Number.	Total.	Average per Vehicle.	Number.	Capacity.	
LOCOMOTIVES.			lb.	lb.	GOODS STOCK.			
Steam .....	1,375	33,924,365	24,672		tons.	tons.		
Vehicles.		Number.	Capacity (Passengers).					
		Total.	Average per Vehicle.					
COACHING STOCK.								
Passenger Cars—								
1st Class .....	467	25,883	55					
2nd Class .....	983	59,602	61					
Composite .....	221	11,796	53					
Sleeping Cars—								
1st Class .....	88	2,312	26					
2nd Class .....								
Special Cars .....	14	38	3					
Parlor Cars .....								
Dining Cars .....	1	38	38					
Mail Vans .....	24							
Luggage Vans .....								
Carriage Trucks .....	65							
Horse Boxes .....	172							
Hearses .....	4							
Motor Passenger Vehicles .....	6	290	48					
Brake Vans .....	140	78						
Other Vehicles .....	9							
Total .....		2,194	100,037	46				

Box Goods Waggon .....				
Open Goods Waggon .....	14,338	224,974	16	
Cattle Waggon .....	1,260	7,840	6	
Sheep Waggon .....	1,697	10,530	6	
Coal Waggon .....	1,550	20,244	13	
Louved Vans .....	1,627	13,572	13	
Refrigerator Vans .....	241	3,494	15	
Powder Vans ..	61	440	7	
Flat Waggon .....	128	1,344	11	
Bolster Waggon ..	913	30,125	33	
Brake Vans .....	643			
Other Vehicles .....	70	735	11	
Total .....	21,923	313,298	14	

SERVICE STOCK.		Number.	
Casualty or Break-down Vans.....		40	
Water Trucks .....		191	
Loco. Coal Trucks .....		284	
Ballast Waggon .....		712	
Gas Vehicles .....		28	
Workmen's Vans.....		25	
Store Vans .....		32	
Cranes (not Locomotive) .....			
Plough Vans .....		11	
Motor Inspection Cars .....		8	
Pay Cars .....			
Other Vehicles.....		617	
Total .....		1,948	

## APPENDIX XI.

RETURN of Persons killed or injured during the years ended 30th June, 1924 and 1923.

	1924.		1923.	
	Killed.	Injured.	Killed.	Injured.
<b>Passengers—</b>				
Through causes beyond their own control .....	...	23	...	22
Through contributory negligence .....	2	1	...	...
Solely through their own action or negligence .....	7	147	10	145
Number of passengers killed and injured per million carried due to causes beyond their own control .....	...	18	...	178
<b>Employees while in the execution of their duty—</b>				
Through causes beyond their own control .....	...	19	...	16
Through contributory negligence .....	...	54	...	63
Solely through their own action or negligence .....	16	186	9	169
<b>Employees proceeding to or from duty within the railway boundary</b>	2	7	1	4
<b>Persons killed or injured at crossings</b>	11	19	3	9
<b>Trespassers</b>	29	13	19	7
<b>Miscellaneous</b>	10	57	3	63
Total .....	77	526	45	498

This return only includes Casualties in connection with Train Working and the movement of Rolling Stock.

## APPENDIX XII.

## APPENDIX XII.

STATISTICAL STATEMENT.—Years ended 30th June, 1924 and 1923.

Particulars.							1924.		1923.	
							Mls.	Chs.	Mls.	Chs.
1. Average mileage of Railways open for traffic ...	...	...	...	...	...	...	5,460	12	5,196	54½
PASSENGER TRAFFIC.										
2. Passenger train mileage ...	...	...	Country	...	...	...	7,532,580		7,241,007	
	...	...	Suburban	...	...	...	4,852,116		4,581,481	
3. Passenger earnings ...	...	...	Country	...	...	£	3,774,911		3,754,999	
	...	...	Suburban	...	...	£	2,302,077		2,149,703	
4. Number of Passengers carried ...	...	...	Country	...	...	...	10,744,868		10,697,392	
	...	...	Suburban	...	...	...	117,356,316		113,017,247	
5. Number of Passengers carried one mile ...	...	...	Country	...	...	...	842,253,687		833,239,323	
	...	...	Suburban	...	...	...	878,907,181		841,663,309	
6. Average miles each Passenger was carried...	...	...	Country	...	...	...	78.39		78.35	
	...	...	Suburban	...	...	...	7.49		7.41	
7. Average number of Passengers per car mile	...	...	Country	...	...	...	17		13	
	...	...	Suburban	...	...	...	22		23	
8. Average earnings from each Passenger ...	...	...	Country	...	...	d.	84.32		81.24	
	...	...	Suburban	...	...	d.	4.71		4.78	
9. Average earnings per passenger mile ...	...	...	Country	...	...	d.	1.08		1.08	
	...	...	Suburban	...	...	d.	.63		.64	
Per Average Mile of Railway Open.

\* The line was opened for three and a half months only in 1879, and for part of this period was worked with horse-power.

† Up to the year 1885, 3d. cash fares and 2d. tickets were counted as single fares; from 1886 to 1899, inclusive, all tickets issued were at 1d. values, and cash fares paid are in this Return calculated at same rate.

APPENDIX XXVII.

TRAMWAY Rolling Stock, years ended 30th June, 1924 and 1923.

	Steam Motors.	Steam Cars.	Electric.		Service and other Vehicles.	Total.
			Motor Cars.	Trailers.		
Stock on 30th June, 1924	26	74	1,494	1	113	1,708
Stock on 30th June, 1923	26	74	1,340	2	113	1,555

One hundred and fifty-three cars of the "P" class type were added to stock; and one electric trailer was converted to motor car.

In addition to the above vehicles there are 66 steam motors, 117 steam cars, 76 electric motor cars, and 2 service vehicles which, although still in service, have been written off Capital Account to Working Expenses and transferred to duplicate stock.

One steam motor charged to Working Expenses was constructed during the year and 3 steam motors were condemned. Two steam cars were sold and 2 condemned.

## RAILWAYS AND TRAMWAYS.

REPORT OF THE COMMISSIONERS FOR THE QUARTER  
ENDED 31st DECEMBER, 1923.*Printed under No. 1 Report from Printing Committee, 17 July, 1924.*

Office of the Railway Commissioners for New South Wales,

Sydney, 4th February, 1924.

TO THE HONORABLE THE MINISTER FOR RAILWAYS,—

Sir,

In accordance with the provisions of Section 39 of the Government Railways Act, 1912, as amended by the Government Railways (Amendment) Act, 1916, we have the honor to submit, for the information of Parliament, our Report for the quarter ended 31st December, 1923, upon the subjects specified, viz.:—

## STATE OF THE TRAFFIC.

RAILWAYS.						Quarter ended 31st December, 1923.	Quarter ended 31st December, 1922.	Increase.	Decrease.
Miles open	...	...	...	...	...	5,430 $\frac{3}{4}$	5,168 $\frac{3}{4}$	262

## RAILWAYS.

## II.—GENERAL CONDITION OF THE LINES AND ACCOMMODATION FOR THE TRAFFIC.

The permanent way, bridges, buildings, wharves and fences have been efficiently maintained during the quarter.

Good progress has been made with the work of relaying, re-sleepering and reballasting the lines.

On the Western line the remainder of the duplication and deviation between Bowenfels and Cox's River has been completed, and was opened to traffic on the 28th October.

On the Illawarra line the quadruplication between Tempe and Rockdale has been completed, and was opened to traffic on the 28th October; work has commenced on the section from Rockdale to Hurstville. Between Thirroul and Wollongong the foundations for an overbridge at Mt. Pleasant crossing are well in hand; the new bridge at Minnamurra River has been completed and pile driving is now in hand for the abutments and piers for the double line portion of the bridge.

Between Lidcombe and Regent's Park, duplication and regrading work has proceeded satisfactorily. The main girders for the down road overbridge at Bridge-street have been placed in position, and the brickwork for the abutment of the underbridge at Vaughan-street has been completed. The earthwork for the loop connection to the main line at Lidcombe is about three-fourths done.

The following duplications and deviations have been completed during the quarter :—

Western line—	Date opened.	m. chs.
Middle River to Cox's River	... 28th Oct., 1923	... 4 23½ duplication.
" " "	... 28th " "	... 3 65 deviation.
Illawarra Line—		
Tempe to Rockdale	... 28th " "	... 2 39 quadruplication.

The bridge over Cook's River at Tempe in connection with the electrification of the railway lines between Sydney and National Park, has been completed, and was opened to traffic on the 27th October. The earthworks for the new car sheds at Mortdale and Punchbowl are approaching completion.

Further progress has been made in developmental work at the departmental coal mine at Lithgow. Work is now proceeding on the erection of an additional screen to deal with top coal, the erection of downcast steel head-frame and winding engine, and the foundation for screening plant, retaining wall and workshops. The output of coal is approximately 23,000 tons per month.

The construction of a tunnel for electrical transmission cables under Sydney Harbour from Longnose Point to Greenwich is approaching completion.

Other important works to provide additional accommodation for the traffic have been proceeded with during the quarter.

## CITY AND SUBURBAN ELECTRIC RAILWAY.

Construction work on this railway has proceeded during the quarter.

The excavation for the tracks on the western side of the Cleveland-street bridge is now in hand.

The masonry for the south abutment and south footpath pier of the Eddy-avenue bridge and the concrete backing of the south abutment to springing line have been completed, and a commencement made with the concrete filling of the south pier.

The rock-faced masonry of the Elizabeth-street retaining wall from Eddy-avenue to Hay-street has been finished together with about one-third of the parapet; the concrete backing is nearing completion. The masonry abutments for the Hay-street bridge have also been completed. The retaining walls supporting the tracks from Hay-street to Campbell-street are nearly finished. Work in connection with the construction of a bridge at Campbell-street has been held in abeyance pending negotiations with the City Council.

Work has continued on the driving of a tunnel for a new and enlarged water intake for the Ultimo Power House in connection with the Darling Harbour reclamation scheme.

The twin tunnels south of Liverpool-street have been completed and concreted for a distance of 233 feet.

The work of concreting the side walls and reinforced arch roof of the Liverpool-street Station has been pushed forward, the roof having been finished for a total length of 400 feet. Further progress has been made with the construction of the tunnels from Liverpool-street to St. James'.

The open cut south of Park-street has now been completely excavated and the whole of the concrete completed. The excavation work at St. James' Station has proceeded satisfactorily.

The driving for the Up and Down City East tunnels has made good progress and concreting operations will be undertaken at an early date.

## RAILWAY CONSTRUCTION.

The construction of new lines of railway has been proceeded with as follows:—

	Mls.	Chns.
Glenreagh to Dorrigo ... ..	44	20
Macksville to Urunga (opened to public traffic 3rd December) ...	17	20
Regent's Park to Cabramatta ... ..	5	54
Regent's Park to Enfield Marshalling Yards ... ..	3	00
Sydenham to Botany ... ..	5	16
Gilmore to Kunama (opened to public traffic 17th December) ...	21	45
Tarana to Oberon (opened to public traffic 3rd October) ...	15	7
Molong to Dubbo... ..	80	00
Binnaway to Werris Creek ... ..	90	70
The Rock to Pulletop ... ..	26	10
Roslyn to Taralga ... ..	15	66
Richmond to Kurrajong ... ..	6	71

The earthworks and culverts on the section from Glenreagh to Dorrigo are practically finished, the steel bridge over Bobo Creek has been completed, and the concrete piers for the bridges over Wild Cattle, Bielsdown, and Deep Creeks have been placed in position. Platelaying has been completed for a distance of 25 miles. The extension from Macksville to Urunga has been finished and was opened to public traffic on the 3rd December.

Work has been completed on the section from Regent's Park to Enfield, and good progress made with the work from Regent's Park to Cabramatta. The bridge over Shea's Creek on the Sydenham to Botany line has been finished, but other work is hampered through lack of steel supplies.

The extensions from Gilmore to Kunama and from Tarana to Oberon have been completed, and were opened to public traffic on the 17th December and 3rd October respectively.

Platelaying has not progressed beyond Little River on the section from Molong to Dubbo, but will be continued now that the steel bridge over that river has been erected. Ballasting work has been pushed forward. The steel bridge over the Macquarie River has been completed.

Work on the section from Binnaway to Werris Creek is approaching completion, and public traffic is being carried over the line.

Platelaying has been finished for a length of 12 miles on the extension from The Rock to Pulletop, and the earthworks beyond that distance are well in hand. Good progress is being made with the earthworks and culverts between Roslyn and Taralga.

Work has been commenced on the extension from Richmond to Kurrajong.

Trial surveys for proposed new lines from Morpeth to Port Stephens and Tempe to East Hills were completed during the quarter. Surveys are still in progress from Grafton to Killarney, Casino to Bonalbo, Kyogle to Richmond Gap, Cassilis to Leadville, Maryvale to Gulgong, and North Sydney to Manly.

## III.—SPECIAL RATES AND FARES.

A statement of the special rates, and the reasons for making the same, will be found attached as an Appendix (No. 1), page 5.

## IV.—STAFF.

These returns are given as an Appendix (No. 2), pages 6 to 13.

## GENERAL REMARKS.

The earnings show an increase of £67,151, and the expenditure a decrease of £56,916, as compared with the corresponding quarter of the previous year.

In coaching traffic there was an increase of £17,016, made up as follows:—First-class passengers, increase £3,778; miscellaneous increase, £13,894; second-class passengers, decrease £656.

The earnings from goods traffic increased by £50,135, the details being—Increases: Hay, straw, and chaff, £54,687; coal and coke, £80,683; minerals, other than coal and coke, £25,458; miscellaneous, £4,843. Decreases: General merchandise, £20,211; grain, flour, &c., £13,622; wool, £54,277; live stock, £17,426.

The tonnage carried for the quarter shows an increase of 609,955 tons, made up of increases in general merchandise, 73,444 tons; hay, straw, and chaff, 47,375 tons; grain, flour, &c., 26,257 tons; coal and coke, 412,140 tons; minerals other than coal and coke, 53,818 tons; live stock, 9,972 tons; whilst there was a decrease in wool of 13,051 tons.

The decrease in expenditure is principally due to continued improvement in operation.

The train mileage for the quarter shows an increase of 612,358 miles, and the number of passengers carried an increase of 1,147,133, as compared with the corresponding period of the previous year.

## TRAMWAYS

## TRAMWAYS.

The tramway earnings for the quarter show a decrease of £9,100, and the expenditure a decrease of £26,562, as compared with the corresponding quarter of the previous year. The latter decrease is due principally to the restoration of the 48-hour working week.

The mileage for the quarter increased by 479,748 miles, and the number of passengers carried by 2,221,719.

The tonnage of goods, the property of the Crown, carried on the Tramways during the quarter was 6,723 tons; the charges for the carriage of such goods amounted to £768, and the cost of carriage to £719.

The following tramway extension was opened to traffic during the quarter:—

17th December, King Max street, between Bradley's Head road and Military-road, Mosman, 10½ chains, double track.

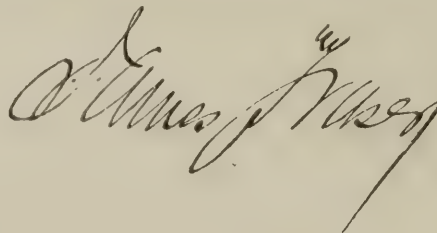

The construction of a new line of tramway from Undercliffe to Forest Hill is approaching completion.

Trial surveys were carried out during the quarter on proposed tram lines from Manly to Castle Rock and Rockdale to Bexley, and on a deviation of the Zetland to Rosebery tramway.

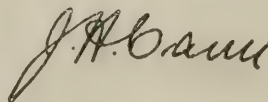

We have the honor to be,

Sir,

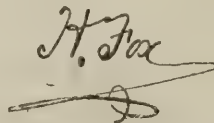

Your most obedient servants,

Chief Railway Commissioner.

Assistant Railway Commissioner.

Assistant Railway Commissioner

## APPENDIX I.

## NEW SOUTH WALES GOVERNMENT RAILWAYS AND TRAMWAYS.

STATEMENT of Special Rates and Fares approved during the Quarter ended 31st December, 1923.

Traffic.	Particulars and Rate.	Reason for Rate.
Shunting, Wagga to Wagga Stock Yards, for Hardy & Son.	2s. 11d. per four-wheeled truck, maximum 5s. 10d. for every fifteen minutes or part thereof.	To equalise rates and encourage traffic.
Shunting, Rozelle to Wharf Siding, for Mulhearn Bros.	1s. 2d. per truck, maximum 5s. 10d. for every fifteen minutes or part thereof.	

## APPENDIX II.

## NEW SOUTH WALES GOVERNMENT RAILWAYS AND TRAMWAYS.

RETURN, in accordance with Section 39 of the Government Railways Act, 1912, as amended by the Government Railways (Amendment) Act, 1916, showing the Appointments and Removals of Employees for the quarter ended 31st December, 1923.

## LEGISLATIVE ASSEMBLY.

## NEW SOUTH WALES.

## RAILWAYS AND TRAMWAYS.

REPORT OF THE COMMISSIONERS FOR THE QUARTER  
ENDED 31st MARCH, 1924.*(Printed under No. 1 Report from Printing Committee, 17 July, 1924.)*Office of the Railway Commissioners for New South Wales,  
Sydney, 2 May, 1924.

TO THE HONORABLE THE MINISTER FOR RAILWAYS,—

Sir,

In accordance with the provisions of Section 39 of the Government Railways Act, 1912, as amended by the Government Railways (Amendment) Act, 1916, and as subsequently amended, we have the honor to submit, for the information of Parliament, our Report for the quarter ended 31st March, 1924, upon the subjects specified, viz. :—

## I.—STATE OF THE TRAFFIC.

RAILWAYS.					Quarter ended 31st March, 1924.	Quarter ended 31st March, 1923.	Increase.	Decrease.
Miles open	...	...	...	...	5,522½	5,250½	272	.....
	1924.	1923.

Number of passengers carried	...	...	...	...	88,270,454	85,020,739	3,249,715	.....

## RAILWAYS.

## II.—GENERAL CONDITION OF THE LINES AND ACCOMMODATION FOR THE TRAFFIC.

The permanent-way, bridges, buildings, wharves, and fences have been efficiently maintained during the quarter.

The work of relaying, resleepering, and reballasting the lines has made good progress.

On the Illawarra line the quadruplication between Rockdale and Hurstville has continued, the earthworks now being about one-half completed. Between Thirroul and Wollongong the work on the overbridge at Mt. Pleasant has progressed satisfactorily. The abutments and piers for the double line portion of the bridge over the Minnamurra River between Wollongong and Kiama are practically complete.

Duplication work between Lidcombe and Regent's Park has also made satisfactory progress, the whole of the girders for the Bridge-street and Kerr's-road underbridges being in position; the excavations are well in hand for the extension of the wings at the Vaughan-street underbridge.

The duplication between Murrumburrah and Demondrille Creek Junction is complete with the exception of the Demondrille footbridge.

The following duplications have been completed during the quarter:—

Northern Line—		Date Opened.	mls.	chs.	
Adamstown to Woodville Junction	...	2nd March, 1924	0	21½	Down third relief road.
Broadmeadow to Adamstown	...	10th March, 1924	0	65½	Fourth relief road.
Suburban Line—					
Auburn to Clyde North	...	10th March, 1924	1	0¾	Third relief road.

The earthworks for the new carriage sheds at Mortdale and Punchbowl, and the sidings at the latter shed, are completed.

Development work at the Departmental coal-mine at Lithgow has continued. In the downcast shaft a section of the arching on the southern side has been finished, and the concreting of the shaft walling is now in hand. In the upcast shaft the auxiliary fan will shortly be installed. Good progress is being made with the permanent timbering of the northern drives. Of the surface equipment the additional screen to deal with the top coal will soon be in operation; riveting of the downcast steel head frame is almost completed; and progress has been made with the foundations for the screening plant and steel gantries, and also with the downcast winding engine and house. The output of coal is approximately 21,000 tons per month.

The construction of the tunnel for the electrical transmission cables under Sydney Harbour, from Longnose Point to Greenwich, is completed.

Other important works to provide additional accommodation for the traffic have proceeded during the quarter.

## CITY AND SUBURBAN ELECTRIC RAILWAY.

Work in connection with the construction of this railway has made good progress during the quarter.

The excavation for the tracks on the western and southern side of the Cleveland-street bridge has been completed.

The reinforced concrete arch and beams over the southern span of the Eddy-avenue bridge has been finished, and the concrete over the northern footpaths has been waterproofed and the approach for the arch filled in.

The rockfaced masonry of the Elizabeth-street wall, including the parapet, has been completed. The reinforced concrete arch for the Hay-street bridge has been poured and the removal of the centring will shortly be taken in hand. Further work in connection with the construction of a bridge at Campbell-street is now being proceeded with, the negotiations with the City Council having been finalised.

The drive between Nos. 3 and 4 shafts in connection with the Darling Harbour reclamation scheme has been completed to full width. Nos. 2 and 3 shafts have been connected up, and widening out is well in hand. The laying of the double 6-foot monier pipes is making good progress.

Excavation and brickwork on the three wall headings for the twin tunnels south of Liverpool-street have been completed for a distance of 115 feet during the quarter, and further progress has been made with the concreting.

At the Liverpool-street station the excavation of the subways on the eastern side of the cutting has been pushed forward and a section is now ready for concreting. The work of concreting the remainder of the main arch sidewalls of the southern end of the station has been practically completed.

The driving of the Up and Down City East tunnels from Liverpool-street to St. James' has continued and the concrete lining of the two tunnels has been pushed forward continuously as the driving progressed.

The excavation for the footings for the centre walls and column bases, and the concrete footings for the sidewalls of the St. James' station, have been completed.

Work in connection with the Up and Down City East tunnels from St. James' station towards Circular Quay has progressed satisfactorily, the concrete lining of the former tunnel being nearly completed, while similar work on the latter is proceeding rapidly.

Excavation and other work for the Eastern Suburbs Railway was commenced during the quarter.

RAILWAY

## 3

## RAILWAY CONSTRUCTION.

The construction of new lines of railway has been proceeded with as follows :—

	Mls.	Chs.
Glenreagh to Dorrigo ... ..	44	20
Regent's Park to Cabramatta ... ..	5	54
Regent's Park to Enfield Marshelling Yards... ..	3	0
Sydenham to Botany ... ..	5	16
Molong to Dubbo ... ..	80	0
The Rock to Pulletop ... ..	26	10
Roslyn to Taralga ... ..	15	66
Richmond to Kurrajong ... ..	6	71
Castle Hill to Rogan's Hill ... ..	0	60
Trida to Menindie ... ..	159	40

On the section from Glenreagh to Dorrigo the steel bridges have been completed with the exception of the one over Deep Creek, which is in hand. Plate-laying has been completed for a distance of 32 miles.

Work on the extension from Regent's Park to Cabramatta is approaching completion ; the section from Regent's Park to Enfield Marshelling Yards has been completed.

The concrete bridge over old Botany Road on the Sydenham to Botany line has been completed, and work on other bridges will shortly be taken in hand.

Between Molong and Dubbo plate-laying has been completed for a distance of 60 miles from Molong, and ballasting work is well in hand. The section from Binnaway to Werris Creek has been finished.

Work is proceeding on the earthworks from The Rock to Pulletop and Roslyn to Taralga, but only slow progress is being made.

On the section from Richmond to Kurrajong progress is slow owing to delays in obtaining possession of the necessary land ; the rails are laid through the town of Richmond. Work has recently been started on the extension from Castle Hill to Rogan's Hill.

Between Trida and Menindie work has recommenced.

Permanent surveys for new railway lines from Booyong to Ballina and Castle Hill to Rogan's Hill, and trial surveys for proposed new lines from Maryvale to Gulgong, Casino to Bonalbo, Cassilis to Leadville, and North Sydney to Manly, have been completed during the quarter. Alternative rough trial surveys of portions of the proposed line from Casino to Bonalbo have also been carried out. The permanent survey of the Kyogle to Richmond Gap line, and the trial survey of the Grafton to Killarney line are still in progress.

## III.—SPECIAL RATES AND FARES.

A statement of the special rates and fares, and the reasons for making the same, will be found attached as an Appendix (No. 1), page 5.

## IV.—STAFF.

These returns are given as an Appendix (No. 2), pages 6 to 12.

## GENERAL REMARKS.

The earnings compared with those of the corresponding quarter of the previous year show an increase of £47,389, and the expenditure an increase of £71,888. This latter increase is principally caused by the increase in the basic wage.

In coaching traffic there is an increase of £1,217, made up as follows: Miscellaneous, increase £28,634; first-class passengers, decrease £13,711; second-class passengers, decrease £13,706.

The earnings from goods traffic show an increase of £46,172, the details being: Grain, flour, &c., increase £126,261; coal and coke, increase £8,452; miscellaneous, increase £7,582; general merchandise, decrease £29,322; hay, straw, and chaff, decrease £9,223; wool, decrease £1,849; live stock, decrease £55,182; minerals, other than coal and coke, decrease £547.

There is a net increase of 246,318 tons in the tonnage carried, as compared with that of the corresponding quarter of the previous year, due to increases in grain, flour, &c., 154,477 tons; coal and coke, 159,845 tons; minerals, other than coal and coke, 23,060 tons; live stock, 1,435 tons; and decreases in general merchandise, 80,020 tons; hay, straw, and chaff, 12,043 tons; wool, 436 tons.

The train mileage for the quarter shows an increase of 515,781 miles, and the number of passengers carried, an increase of 1,069,105, as compared with the results of last year's quarter.

## TRAMWAYS.

## TRAMWAYS.

The operations of the tramways for the quarter show an increase of £17,429 in the earnings, and an increase of £22,950 in expenditure as compared with the corresponding quarter of the previous year. The excess expenditure is mainly due to heavier renewals of rolling stock and the increase in the basic wage.

The tramway mileage is 597,805 miles in excess of that of the previous year's quarter, while 3,249,715 more passengers were carried.

The tonnage of goods, the property of the Crown, carried on the tramways during the quarter was 1,220 tons; the charges for the carriage of such goods amounted to £351, and the cost of carriage to £281.

The following tramway extensions were opened to traffic during the quarter:—

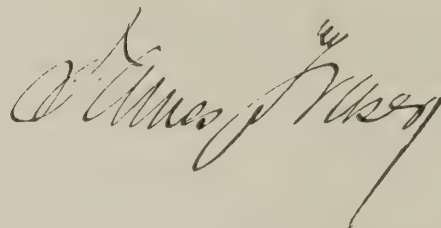

22nd January.—Extension of Lilyfield line to Brennan-street, 11 chains, double track

18th February.—Undercliffe to Earlwood, 1 mile 19¼ chains, single track.

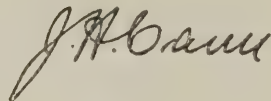

We have the honor to be,

Sir,

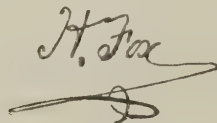

Your most obedient servants,

Chief Railway Commissioner.

Assistant Railway Commissioner.

Assistant Railway Commissioner.

## APPENDIX I.

## NEW SOUTH WALES GOVERNMENT RAILWAYS AND TRAMWAYS.

STATEMENT of Special Rates and Fares approved during the Quarter ended 31st March, 1924.

Traffic.	Particulars and Rate.	Reason for Rate.
Shunting, West Tamworth to Regan Palace Flour Mills siding.	2s. 11d. per four-wheeled truck, maximum 5s. 10d. for every fifteen minutes or part thereof.	To equalise rates and encourage traffic.

## APPENDIX II.

## APPENDIX II.

## NEW SOUTH WALES GOVERNMENT RAILWAYS AND TRAMWAYS.

RETURN, in accordance with Section 39 of the Government Railways Act, 1912, as amended by the Government Railways (Amendment) Act, 1916, showing the Appointments and Removals of Employees for the quarter ended 31st March, 1924.

## APPOINTMENTS.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## RAILWAYS AND TRAMWAYS.

REPORT OF THE COMMISSIONERS FOR THE QUARTER  
ENDED 30TH JUNE, 1924.*Printed under No. 9 Report from Printing Committee, 11 September, 1924.*Office of the Railway Commissioners for New South Wales,  
Sydney, 2nd September, 1924.

TO THE HONORABLE THE MINISTER FOR RAILWAYS,—

Sir,

In accordance with the provisions of Section 39 of the Government Railways Act, 1912, as amended by the Government Railways (Amendment) Act, 1916, and as subsequently amended, we have the honor to submit, for the information of Parliament, our Report for the quarter ended 30th June, 1924, upon the subjects specified, viz.:—

## I.—STATE OF THE TRAFFIC.

RAILWAYS.				Quarter ended 30th June, 1924.	Quarter ended 30th June, 1923.	Increase	Decrease.
Miles open	...	...	...	5,522 <sup>3</sup> / <sub>4</sub>	5,317 <sup>3</sup> / <sub>4</sub>	205	
	1924.	1923.					
Revenue {	Passenger £1,915,236	£1,788,374		£3,675,363	£3,646,801	£28,562	
	Merchandise £1,760,127	£1,858,427					
Expenditure	...	...	...	£2,653,178	£2,386,558	£266,620

## RAILWAYS.

## II.—GENERAL CONDITION OF THE LINES AND ACCOMMODATION FOR THE TRAFFIC.

The permanent way, bridges, buildings, wharves and fences have been efficiently maintained during the quarter.

Good progress has been made with the work of relaying, resleepering and reballasting the lines.

Quadruplication work between Rockdale and Hurstville is progressing, the earthworks between Carlton and Kogarah being about three-fourths completed. The excavation work for the overbridge at Mount Pleasant crossing, between Thirroul and Wollongong, has been finished and the abutments and wing walls are well in hand. Between Wollongong and Kiama the bridge over the Minnamurra River has been completed.

Duplication work has continued between Lidcombe and Regent's Park. The existing track has been lifted to the new grading, the steel underbridges at Bridge-road and Kerr's-road have been finished, and the underbridge at Vaughan-street is approaching completion.

The first stage of the work of quadruplication between Flemington and Lidcombe has been finished and was opened to traffic on the 16th June last.

The following duplications and deviations have been completed during the quarter :—

Suburban Line.	Date opened.	mls.	chns.
Flemington to Lidcombe Goods Junction...	16th June	1	23½

Quadruplication.

Work in connection with the quadruplication and electrification of the railway line between Sydney and National Park has made further progress. The excavation for retaining walls and underpinning for the new eastern platform at Redfern is in hand. Practically all masts have been erected for the trial section from Sydenham to Rockdale. The erection of the new electric car sheds at Mortdale and Punchbowl is proceeding satisfactorily.

Good progress has been made with the developmental work at the departmental coal-mine at Lithgow. Concreting of the downcast shaft has been completed and the underground grading and arching on the north side is now in hand. The auxiliary fan in the upcast shaft has been installed and is giving good results. The additional temporary screen installed on the surface to ensure more efficient cleaning of the coal is now in operation. The installation of the remaining surface equipment is proceeding satisfactorily.

Construction work in connection with the train ferry over the Clarence River is well in hand, and progress has kept pace with the delivery of material. The alterations to the s.s. "Swallow" to be used as a ferry, will probably be completed in a few weeks' time.

The rearrangements at the new Milson's Point station in connection with the Sydney Harbour Bridge were completed and the station brought into use on the 28th July last.

The construction of the new locomotive workshops, signal engineer's depot, and electric carriage shops at Chullora, are making progress, and the erection of a new carriage shed at the eastern side of Sydney yard is now in hand.

Other works to provide additional accommodation for the traffic have proceeded during the quarter.

## CITY AND SUBURBAN ELECTRIC RAILWAY.

Construction work on that short section of this railway which has been authorized has proceeded during the quarter.

Good progress has been made with the construction of a bridge over Campbell-street.

The Darling Harbour reclamation scheme has been pushed forward, and the driving of the tunnel for a new and enlarged circulating water intake for Ultimo Power-house is well in hand.

The driving of the twin tunnels under Liverpool-street towards Goulburn-street, has continued satisfactorily, a length of 350 feet having been completely lined with concrete. Beyond the finished tunnels the brick side and centre walls have proceeded to within about 1 chain of the starting point of the special steel flat top construction to be carried forward towards Goulburn-street.

The whole of the side walls and the main arch have been completed at the Liverpool-street station, and the entrance and exit subways on the eastern side concreted as far as the concourse platform at each end. The exit subways on the north-western side are nearing completion.

The driving and lining of the tunnels for the Up and Down City east roads, extending from Liverpool-street to St. James' station, is now practically finished.

The concreting work on the main side-walls of the St. James' station has made good progress, and the work of concreting the footings for the piers in the centre and on the platforms is well in hand.

Work has continued on the driving of the three tunnels from St. James' station under Macquarie street, and the two main tunnels have now reached a point opposite the Sydney Hospital. The special construction of the Up City east and Eastern Suburbs road has been completed and the concrete arch constructed. Excavation work is now proceeding at the cross-over from the Up to the Down City east roads. The concreting of the tunnels is proceeding concurrently with the driving.

The twin tunnel under Park-street for the Eastern Suburbs railway has been completed on the southern side, and the work is proceeding rapidly on the northern side.

RAILWAY

## RAILWAY CONSTRUCTION.

The construction of new lines of railway has been proceeded with as follows :—

	Mls.	Chs.
Glenreagh to Dorrigo ... ..	42	76
Regent's Park to Cabramatta ... ..	5	54
Regent's Park to Enfield Marshalling Yards ... ..	3	18
Sydenham to Botany ... ..	5	16
Molong to Dubbo ... ..	80	12
The Rock to Pulletop ... ..	26	10
Roslyn to Taralga ... ..	15	66
Richmond to Kurrajong ... ..	7	0
Castle Hill to Rogan's Hill ... ..	0	77
Trida to Menindee ... ..	156	1

On the section from Glenreagh to Dorrigo platelaying has been completed for a distance of 36 miles 76 chains and the line fully ballasted for a distance of  $33\frac{1}{4}$  miles. The bridge over Deep creek has not yet been finished, but everything is in readiness to place the steelwork in position.

Work on the Regent's Park to Cabramatta line and Regent's Park to Enfield marshalling yards has been practically completed; goods traffic is now being conveyed from Cabramatta to Enfield marshalling yards.

Progress in connection with the erection of the steel bridges on the Sydenham to Botany section has advanced sufficiently as to permit of the resumption of the earthworks, which work is now being undertaken.

On the line from Molong to Dubbo platelaying has been completed for a distance of 77 miles, and ballasting work is making good progress. Station buildings at Cumnock are in course of erection.

Only moderate progress is being made with the sections from The Rock to Pulletop and Roslyn to Taralga. The earthworks are in hand, but platelaying has not yet been commenced.

Between Richmond and Kurrajong work has proceeded on the earthworks and waterways, satisfactory progress having been made.

The earthworks on the Castle Hill to Rogan's Hill section are sufficiently advanced to permit of plate-laying being shortly taken in hand.

The reconditioning of the earthworks on the Trida to Menindee line is well forward and platelaying has recently been commenced.

## III.—SPECIAL RATES AND FARES.

A statement of the special rates and fares, and the reasons for making the same, will be found attached as an Appendix (No. 1), page 5.

## IV. STAFF.

These returns are given as an Appendix (No. 2), pages 6 to 14.

## GENERAL REMARKS.

The earnings for the quarter show an increase of £28,562 and the expenditure an increase of £266,620 as compared with the corresponding quarter of the previous year. This latter increase is due principally to heavier renewal charges and the increase in the basic wage.

Coaching traffic shows an increase of £126,862, made up of increases in first-class passengers, £14,318; second-class passengers, £69,572; and miscellaneous, £42,972.

The earnings from goods traffic show a decrease of £98,300, made up as follows :—decreases, hay, straw and chaff, £43,349; live stock, £158,874; miscellaneous, £288. Increases, general merchandise, £14,567; grain, flour, &c., £50,895; wool, £1,691; coal and coke, £36,857; and minerals, other than coal and coke, £201.

The tonnage carried for the quarter shows an increase of 548,580 tons, of which the details are : grain, flour, &c., increase 79,756 tons; wool, increase 416 tons; coal and coke, increase 545,182 tons; minerals, other than coal and coke, increase 27,297 tons; general merchandise, decrease 3,616 tons; hay, straw and chaff, decrease 51,736 tons; live stock, decrease 48,719 tons.

The train mileage for the quarter shows an increase of 246,069 miles, and the number of passengers carried an increase of 1,474,550 over the corresponding quarter of last year.

## TRAMWAYS

## TRAMWAYS.

The tramway earnings for the quarter show an increase of £35,146 and the expenditure an increase of £5,695 over the previous year's quarter. The increased expenditure is due to an increase in the basic wage.

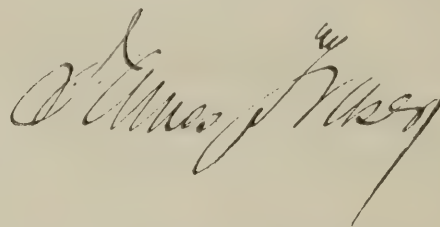

The tramway mileage for the quarter increased by 661,019 miles and the number of passengers carried by 3,419,826.

The tonnage of goods, the property of the Crown, carried over the tramways during the quarter was 380 tons; the revenue derived from the carriage of such goods amounted to £128, and the cost of carriage to £105.

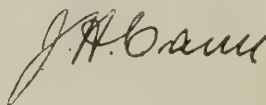

We have the honor to be,

Sir,

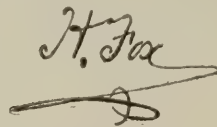

Your most obedient servants,

Chief Railway Commissioner.

Assistant Railway Commissioner.

Assistant Railway Commissioner.

APPENDIX I.

NEW SOUTH WALES GOVERNMENT RAILWAYS AND TRAMWAYS.

STATEMENT of Special Rates and Fares approved during the Quarter ended 30th June, 1924.

Traffic.	Particulars and Rate.	Reason for Rate.
Children under 16 years of age travelling from their homes to the Junior Red Cross Home for Children at Leura.	One-third of ordinary single fare.....	} To equalise rates and encourage traffic.
Visitors to celebration of Diploma Day at Hawkesbury Agricultural College, Richmond.	Single fare plus one-third.....	
Dead fresh poultry from freezing works, Mudgee to Sydney.	Bulk weight to be charged for .....	
Clothing consigned to "Save the Children Fund," Sydney, at owner's risk.	One-quarter parcels rates .....

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

## RAILWAYS AND TRAMWAYS.

REPORT OF THE COMMISSIONERS FOR THE QUARTER  
ENDED 30TH SEPTEMBER, 1924.*Printed under No. 16 Report from Printing Committee, 6 November, 1924.*

Office of the Railway Commissioners for New South Wales,

Sydney, 31st October, 1924.

TO THE HONORABLE THE MINISTER FOR RAILWAYS,—

Sir,

In accordance with the provisions of Section 39 of the Government Railways Act, 1912, as amended by the Government Railways (Amendment) Act, 1916, and as subsequently amended, we have the honor to submit, for the information of Parliament, our Report for the quarter ended 30th September, 1924, upon the subjects specified, viz. :—

## RAILWAYS.

## II.—GENERAL CONDITION OF THE LINES AND ACCOMMODATION FOR THE TRAFFIC.

The permanent way, bridges, buildings, wharves and fences have been efficiently maintained during the quarter. Good progress has been made in the work of relaying, resleepering, and reballasting.

The quadruplication work between Rockdale and Hurstville has proceeded, the earthworks being practically completed. The alterations at Hurstville are in hand and three platform roads are now in use.

The alterations to the station buildings at Carlton and Kogarah are proceeding and the overbridge at Kogarah is practically completed. The Harrow-road subway at Rockdale has been commenced.

The work in connection with the duplication between Thirroul and Wollongong has been completed.

The quadruplication of the lines between Flemington and Lidcombe has been completed and opened for traffic.

The widening of the existing platforms and footbridge, alterations to the existing station building at Lidcombe, and the rebuilding of one platform at Rookwood are proceeding.

The widening of the existing lines in connection with the electrification scheme is proceeding; the engine roads, Illawarra roads and Bankstown roads between the Illawarra Junction and Redfern having been lifted to their new formation level without speed reduction.

The new Milson's Point station has been opened for traffic.

The construction of the new locomotive Workshops, Signal Engineer's depot, and electric car repair shops, Chullora, continues to make progress.

Work in connection with the eastern carriage shed, Sydney Yard, new electric car shed, Mortdale, and carriage shed sidings at Punchbowl has been proceeded with.

The buildings in connection with the new station between Eskbank and Lithgow were practically completed and the footbridge and booking office are in hand.

The works in connection with the extensions of the White Bay Power House have made good progress; and roofing has been completed so far as to enable a commencement to be made with the erection of machinery. The Zarra-street Power House has been practically completed.

The conversion of the s.s. "Swallow" for conveying rolling stock over the Clarence River has been finished and the train ferry is now in use.

The branch line from Matakana to Mount Hope (10 miles 32 chains single line) has been closed for traffic.

*Departmental Coal Mine, Lithgow.*—All machinery and general plant in connection with the coal production at the upcast shaft has been maintained in an efficient manner. The housing for the new electric main and tail set is complete and a commencement made to erect the machinery. The concreting and arching operations on the north side of the downcast shaft have been completed to a length of 66 feet. Good progress has been made with the erection of screening plant in connection with the surface equipment. The output of coal is approximately 23,428 tons per month.

Other works necessary to provide additional accommodation for the traffic have also been proceeded with during the quarter.

## CITY AND SUBURBAN ELECTRIC RAILWAY.

The construction work on this railway has proceeded during the quarter.

*Bridges.*—The excavation for the northern half of the bridge over Cleveland-street has been completed, also the brickwork in abutments, piers and arches. The spandril fillings in parapet walls are in hand.

The footpath arches on each side of Eddy-avenue have been completed, the footwalks have been graded and asphalted, and the roads opened for pedestrian traffic. Arrangements are now being made for the construction of the two roadway piers for carrying the main arches.

The masonry-faced reinforced concrete arched bridge over Hay-street was completed, the roadway restored and the street reopened for traffic.

The reinforced concrete arch over Campbell-street has been completed during the period.

*Tunnels.*—The driving of the headings for the centre and side walls of the tunnel proceeding from Goulburn to Liverpool streets was commenced, and the opening out of the arched portion of the twin tunnels which are being pushed forward towards Goulburn-street from Liverpool-street was completed and concreted for an additional 90 feet.

The driving and lining of the twin tunnels under Park-street have been completed. The excavation of the remaining portion between Park-street and St. James' station is completed on the down side, and the east side wall and centre wall have been concreted up to the double track tunnel. Considerable portions of the 31 feet, 27 feet and 19 feet and single arches have been completed.

CITY

CITY AND SUBURBAN ELECTRIC RAILWAY—*continued.*

The cut-and-cover on the Up City East side south of St. James' station has been completed and the tunnel concreted. The lining of this tunnel is now complete from Liverpool-street to St. James' station. Additional excavation is now being carried out in the Down City East side close to the junction with the crossover from the Down Eastern Suburbs.

The driving and concreting of the tunnels from St. James' station towards Circular Quay has now reached a point on the boundary between Sydney Hospital and Parliament House.

*Stations.*—Progress was made with the reinforced concrete work in the northern concourse of Central Station.

The excavation of the subways on the south-western side of the Liverpool-street station has been pushed forward and completed for a length of about 140 feet.

The concreting of the reinforced arch piers in the St. James' station has been carried forward and completed to within 50 feet of the north end of the station. The concreting of the reinforced main arches of this station was commenced.

*General.*—Progress was made in connection with the circulating water intake to Ultimo Tower House.

The masonry-faced overhead construction from the northern footpath arch of Eddy-avenue bridge to the northern end of Campbell-street bridge is nearly completed, and the erection of the mounded parapet continued throughout the entire length.

The general excavation for the Railway Administrative buildings was proceeded with, also concreting of retaining walls and footings of the main columns.

## RAILWAY CONSTRUCTION.

The construction of new lines of railway has been proceeded with as follows :

	Miles.	Chains.
Glenreagh to Dorrigo ... ..	42	76
Molong to Dubbo ... ..	80	12
Regent's Park to Cabramatta ... ..	5	54
Sydenham to Botany ... ..	5	16
The Rock to Pulletop... ..	26	10
Roslyn to Taralga ... ..	15	66
Richmond to Kurrajong ... ..	7	...
Castle Hill to Rogan's Hill ... ..	...	77
Trida to Menindee ... ..	156	1

*Glenreagh to Dorrigo Railway.*—The earthworks have been practically completed, and the rails laid into Dorrigo. All steel bridges have been completed and ballasting has proceeded over the last 10 miles. Station buildings are in hand.

*Molong to Dubbo.*—The rails have been laid throughout. Full ballast has been laid for 45 miles, the remainder requiring boxing up only. Station buildings are in hand, these as far as Yeoval approaching completion.

*Trida to Menindee.*—Platelaying is proceeding; the rails having been laid over a distance of 40 miles. Earthworks and station yards are also in hand. The plant necessary for the bridge over the Darling River at Menindee has been assembled and portions are now on the works.

*Regent's Park to Cabramatta and Enfield.*—With the exception of some additions to station buildings and a siding at Regent's Park, all work is finished.

*The Rock to Pulletop.*—Platelaying has been recommenced and is now proceeding towards Westby.

*Sydenham to Botany.*—The work is proceeding on the steel bridge over the Illawarra line and also at the bridge over Botany-road. The embankments between these points are being made up.

*Richmond to Kurrajong.*—The earthworks are nearly finished and work is in hand in the station yards at North Richmond and Kurrajong. Rails have been laid towards the Hawkesbury River where a new bridge is to be built.

*Castle Hill to Rogan's Hill.*—The earthworks and waterways are finished, the rails are laid throughout, and ballasting about half done.

*Roslyn to Taralga.*—Progress has been made with the earthworks and waterways. The alterations to the Roslyn station yard have been completed.

The trial surveys from Grafton to Killarney, Cooma to Adaminaby and Dalgety, Regent's Park to Bankstown deviation were practically completed and the following surveys are proceeding, namely, Kyogle to Richmond Gap, Uranquinty to Moon's Siding, and Camurra to Boggabilla.

## III.—SPECIAL RATES AND FARES,

A statement of the special rates and fares, and the reasons for making the same, will be found attached as an Appendix (No. 1), page 5.

## IV.—STAFF.

These returns are given as an Appendix (No. 2), pages 6 to 17.

## GENERAL REMARKS.

The earnings for the quarter show an increase of £89,439, and the expenditure an increase of £92,835 as compared with the corresponding quarter of the previous year. This latter increase is due principally to cost of increase of traffic and the basic wage.

Coaching traffic shows an increase of £40,653, made up of increases in first-class passengers, £7,497; second-class passengers, £8,585; and miscellaneous, £24,571.

The earnings from goods traffic showed an increase of £48,786, made up as follows:—Increases—General merchandise, £41,780; produce, £17,162; wool, £60,626; coal and coke, £9,054; and minerals, other than coal and coke, £16,194. Decreases—Hay, straw and chaff, £45,806; live stock, £49,210; miscellaneous, £1,014.

The tonnage carried for the quarter shows an increase of 130,935 tons, of which the details are:—Increases—General merchandise, 21,913 tons; produce, 52,801 tons; wool, 14,738 tons; coal and coke, 47,384 tons; minerals, other than coal and coke, 69,920 tons. Decreases—Hay, straw and chaff, 48,641 tons; live stock, 27,180 tons.

The train mileage for the quarter shows an increase of 176,090 miles, and the number of passengers carried, an increase of 845,453 over the corresponding quarter of last year

## TRAMWAYS.

The tramway earnings for the quarter show an increase of £18,617, and the expenditure an increase of £22,696 over the previous year's quarter. The increase in expenditure is mainly due to a Federal Award, increase in the basic wage, and the cost of increased traffic.

The tramway mileage for the quarter increased by 281,846 miles, and the number of passengers carried by 1,883,850.

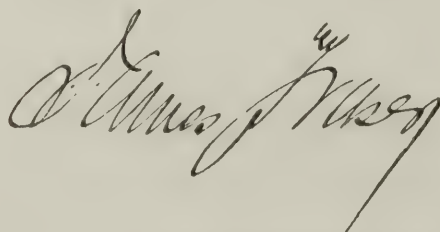

The tonnage of goods, the property of the Crown, carried over the tramways during the quarter was 360 tons; the revenue derived from the carriage of such goods amounted to £68, and the cost of carriage to £55.

The extension from Bourke-place to Zetland and to Crewe-place, Rosebery, a distance of 61½ chains was opened for traffic on 15th September, 1924.

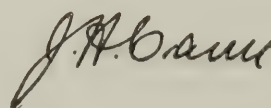

We have the honor to be,

Sir,

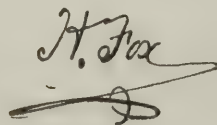

Your most obedient servants,

Chief Railway Commissioner.

Assistant Railway Commissioner.

Assistant Railway Commissioner.

## APPENDIX I.

## NEW SOUTH WALES GOVERNMENT RAILWAYS AND TRAMWAYS.

STATEMENT of Special Rates and Fares approved during the Quarter ended 30th September, 1924.

Traffic.	Particulars and Rate.	Reason for Rate.
Medical students who have not passed the final examination, and who are attending hospital lectures during vacation.	School vacation fares.....	To equalise rates and encourage traffic.
Flowers from Hazelbrook to Sydney City Mission, for distribution amongst sick and poor.	One-quarter parcels rates .....	
Coal in departmental trucks, Kandos Colliery to local cement works.	11s. 8d. per four-wheeled truck per day or part thereof .....	
Shunting, Co-operative Cold Stores Siding, Batlow.	1s. 2d. per truck, maximum 5s. 10d. for every fifteen minutes or part thereof.	

## APPENDIX II.

## NEW SOUTH WALES GOVERNMENT RAILWAYS AND TRAMWAYS.

RETURN, in accordance with Section 39 of the Government Railways Act, 1912, as amended by the Government Railways (Amendment) Act, 1916, showing the Appointments and Removals of Employees for the quarter ended 30th September, 1924.

1924.

CLAIMS OF MR. GEORGE H. DINGLE AGAINST THE RAILWAY  
COMMISSIONERS.

REPORT.

THE SELECT COMMITTEE of the Legislative Assembly, appointed on the 14th August, 1924, "*to inquire into and report upon the claims of Mr. George H. Dingle against the Railway Commissioners, for services rendered during the years 1919 and 1920,*" and to whom was referred on the same date the "*Progress Report from the Select Committee of the Session of 1923, together with the Minutes of Proceedings and Evidence of the Committee,*" have agreed to the following Report:—

Your Committee, having examined the witness whose evidence will be found appended hereto, find:—

1. That George Helson Dingle was instructed to report upon the condition and material of various yards of the Railway Department—he did so, and his investigations extended from 13th October to 10th December, 1919, having made in all 33 reports.

2. That Dingle retired from the service on the ground of ill-health in 1893.

3. Two years subsequently he re-entered the service and reached the age of retirement in 1915, being then 60 years of age.

4. The Department, however, fixed his retirement for 12th October, 1918, and this was extended for one year by the Chief Commissioner, during which period he was placed on special reclamation work and he actually did retire at the end of 1919. On account of his reports a reclamation officer was subsequently appointed.

5. Your Committee are of the opinion that, as disclosed by the evidence, Dingle was a zealous and painstaking member of the Railway Department, and on account of his reports a great saving of apparently waste material was reclaimed amounting to thousands of pounds.

6. That his work was always of a highly satisfactory character, as testified to by several present and past Departmental Officers examined by your Committee and his reports were considered most valuable to the Commissioners.

7. During the time your Committee has been taking evidence Mr. Dingle has been put to an expenditure by Counsel and other expenses of upwards of £50.

8. The claim of £1,000 by Dingle is as follows:—

1. That he was dismissed from the Railway service by reason of disclosures made by him in his reports of surplus and waste railway stock and materials to the approximate value of £1,000,000 under the control of the Railway Commissioners.

2. That he was appointed by the Railway Commissioners for the purpose of reporting upon such surplus and waste stock and was not adequately compensated therefor.

3.

3. By reason of such reports the Railway Commissioners appointed a special reclamation staff officer and employees for the purpose of dealing with such surplus stock and materials, which has resulted in and will continue to result in a very considerable saving in the expenditure required for the administration of the railways and in other ways.

4. That such reports reveal maladministration on the part of officers of the Railway Commissioners, which is now dealt with, following on the reports of the claimant.

5. That the reports of the claimant have been of immense public service to the community.

9. Your Committee, in view of the long, loyal and meritorious service rendered by Mr. Dingle, recommends his claim to the favourable consideration of the Government and that he be paid the sum of £150, or such other sum as the Government may determine to compensate him for his valuable work as temporary reclamation officer, and also to reimburse him for his expenses in connection with the inquiry.

R. B. WALKER,  
Chairman.

*No. 3 Committee Room,  
Legislative Assembly  
Sydney, 19th November, 1924.*

THURSDAY, 4 SEPTEMBER, 1924.

MEMBERS PRESENT :—

Mr. Walker,

Mr. Ness.

In the absence of a quorum, the meeting called for this day lapsed.

TUESDAY, 9 SEPTEMBER, 1924.

MEMBER PRESENT :—

Mr. Ness.

In the absence of a quorum, the meeting called for this day lapsed

WEDNESDAY, 17 SEPTEMBER, 1924.

MEMBERS PRESENT :—

Mr. Walker,

Mr. George Cann,

Mr. Thorby,

Mr. Ness.

Mr. Walker called to the Chair.

Entry from the Votes and Proceedings appointing the Committee, and referring the Progress Report of the Session, 1923, read by the Clerk.

Mr. F. C. Garside (*Controller of Stores, Department of Railways*), made application to represent the Chief Commissioner for Railways.—Leave granted.

Committee deliberated.

Parties called in.

*Present* :—Mr. F. C. Garside (*Controller of Stores, Department of Railways*), appeared for the Chief Commissioner for Railways.

Ernest Edward Lucy (*Chief Mechanical Engineer, Department of Railways*), called in, sworn, and examined.

Witness withdrew.

Adjourned until Thursday, 25th September, at 2.15 o'clock, p.m.

THURSDAY, 25 SEPTEMBER, 1924.

MEMBER PRESENT :—

Mr. Walker.

In the absence of a quorum, the meeting called for this day lapsed.

WEDNESDAY, 1 OCTOBER, 1924.

MEMBERS PRESENT :—

Mr. Walker in the Chair.

Mr. George Cann,

Mr. Ness,

Mr. Anderson.

*Present* :—Mr. F. C. Garside (*Controller of Stores, Department of Railways*) appeared for the Chief Commissioner for Railways.

Mr. Garside addressed the Committee.

Mr. Dingle addressed the Committee.

Re-assembling of Committee to be arranged by the Chairman.

WEDNESDAY,

WEDNESDAY, 19 NOVEMBER, 1924

MEMBERS PRESENT:—

Mr. Walker in the Chair.

Mr. Ness,

Mr Anderson.

Chairman submitted Draft Report.  
Same read, amended verbally, and agreed to.  
Chairman to report to the House.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON THE

CLAIMS OF MR. GEORGE H. DINGLE AGAINST THE  
RAILWAY COMMISSIONERS.

WEDNESDAY, 17 SEPTEMBER, 1924.

Present.—

MR. R. B. WALKER (IN THE CHAIR).

MR. GEORGE CANN,

MR. THORBY.

MR. NESS,

Ernest Edward Lucy, Chief Mechanical Engineer, Department of Railways, sworn, and examined:—

1. *Mr. Dingle.*] In giving evidence on a previous occasion you were asked were my reports of any value to your Department, and you answered that they were of no value. Do you adhere to that statement?—Yes.

2. Do you consider that the pulling up of the railway for some 6 miles about Glenbrook after my report was made was of any service to this country?—The Permanent Way Branch and its movements are not within the scope of my operations or administration, therefore I cannot answer that question.

3. Will you say that all the stuff taken from the Clyde yards, since my report was made, is of no value?—I cannot answer that question.

4. *Mr. Ness.*] It was stated that Clyde was the receptacle for all yards?—That is so.

5. *Mr. Dingle.*] You stated your visit to the Clyde was prior to my inspection, when you found everything in bins?—Some scrap material is kept in bins. Other material is kept in heaps. Wheels and axles are kept in what are called wheel parks.

6. What has become of the material taken from the Clyde yards since my reports were made?—The major part of the material which was at Clyde at the time of your report has since been used or disposed of in one way or another. It is a perpetually moving quantity of a more

or less liquid nature, inasmuch as fresh scrap is being added to the quantity of material there whilst other material is being taken out.

7. Material had been lying in the Clyde yards for a considerable number of years before you took charge. Do you know anything about that?—No.

8. Do you know anything about material that has been lying at Granville for forty years?—I cannot answer that.

9. Do you think my reports, in which I pointed out that hundreds of thousands of pounds worth of stuff were lying in certain places, have been of any value?—No, because those reports did not disclose material lying about unknown to the Department and unrecorded.

10. What have you got recorded and what have you buried in the Clyde yards?—Everything in the Clyde yards was recorded.

11. What quantity of material has been supplied free to the Broken Hill Company, to Hoskins, and to other companies during the four years of the war?—The records are available in the Department.

12. *Mr. Garside.*] The records of the scraps were produced to the Committee.

13. *Mr. Dingle.*] In connection with the Alexandria yards there were about 140 cases of glass. About one-third of that glass, which had been there for six years, was destroyed. Was it of any advantage to the Railway Commissioners to know that glass was there?—I do not

*Witness*—E. E. Lucy, 17 September, 1924.

think so. I recollect your report and the mention of a case of glass, but the case of glass did not belong to my branch.

14. Do you remember anything about thousands of carriage springs in the Redfern yard?—Yes.

15. Were they of any value;—what has been done with them?—Some of those springs were obsolete; some were there for rebuckling and reconditioning, and some for scrap.

16. What has become of them?—There are always heaps of springs in the carriage works yard; they are perpetually being added to and taken from.

17. Was my report with regard to that stuff of any value to you?—No; I knew the springs were there. I had lists of them, of their condition and sizes, kept in accurate and proper groups.

18. Why were the springs allowed to remain there so many years?—During the war, and towards the end of the war more particularly, I deliberately stored up all sorts of material, from second-hand boilers down to all classes of pin material, not knowing when the war would finish, and having in mind that I might have to put old boilers, with greatly reduced pressure, back again on to engines to work very much smaller loads; but at any rate to keep the railways going, because at that time we were prevented by the Munitions Ministry at Home from getting any more new material.

19. If you were so anxious to keep this material for the benefit of the railways, why was it given free of cost to certain companies?—Free of cost—I cannot understand the question.

20. Is it a fact that this material was passed over free of cost to Hoskins, the Broken Hill Company, and the Newcastle Proprietary Company?—I have no recollection of such a thing.

21. When I visited Sutherland, I found material for two tanks, one erected, and the other on the ground, with which nothing was done until I reported upon it. Was that report of any value to the country?—I should think not, because the tank and its location would be known to the Department.

22. *Mr. Thorby.*] What was the object in view when Mr. Dingle was appointed to make certain reports to the Railway Department?—Mr. Dingle told the Locomotive Works Manager that in his opinion there was a lot of material lying about. Mr. Warren, the Locomotive Works Manager, repeated that to me. Knowing Mr. Dingle, and the large quantity of material we had at Clyde, I thought to check all the material lying there. I therefore agreed with Mr. Warren that he should send Mr. Dingle to me to make arrangements for him to commence the inspection.

23. Was any action taken by the Department as the result of the information contained in Mr. Dingle's reports?—No.

24. No action whatever?—No, beyond comparing his reports with the list already extant in my office to see if there were any discrepancies, particularly to see if there was something mentioned in Mr. Dingle's reports which was not in our office records.

25. Was there certain information contained in Mr. Dingle's reports which was not in your office records?—No.

26. Nothing whatever?—No.

27. When was the economy committee appointed—before or after Mr. Dingle's reports?

28. *Mr. Garside.*] It was appointed in 1915.

29. *Mr. Thorby.*] Were the 8,000 axles, referred to as lying in the Clyde yards on 19th December, 1923, condemned axles, or are they still lying in the Clyde yards?—Those that remain unused are still lying in the Clyde yards waiting to be used. They represent a pre-war purchase.

30. Is it not a fact that the Railway Department, immediately after Mr. Dingle submitted his reports to you,

did take action to have a general clean-up of all the yards and depots, and to record or put to use material lying in the various yards and depots?—No, we did not commence any general clean-up to any extent of second-hand material until the war was well over and new material was available. Speaking from memory, it would be about a year after the war terminated before we were able to get such material—as, for instance, boiler plates.

31. Your opinion is that Mr. Dingle's reports were of no material value to your Department?—That is so.

32. *Chairman.*] Was a reclamation officer appointed after Mr. Dingle's reports came in?—I cannot remember whether the reclamation officer was appointed before or after Mr. Dingle's reports came in, but I do not think the appointment of a reclamation officer would be borne upon in any way by Mr. Dingle.

33. You remember the reclamation officer was appointed?—Yes.

34. Who was it?—Cockburn.

35. Mr. Dingle has never been paid any special remuneration for his work?—Nothing beyond his ordinary pay.

36. *Mr. Dingle.*] Do you remember writing a letter to Mr. Hamilton authorising him to allow me to inspect your stock?—Yes.

37. Was that an appointment or not?—I wrote a letter of introduction to Mr. Hamilton for you as an authority to enable you to walk about the yard.

38. Was that an appointment or not?—It was not an appointment.

39. *Chairman.*] It originated through this note: "The bearer, Mr. Dingle, is to be permitted to inspect any scrap material, wheels, axles, tyres, &c., at your premises. E. Lucy, 7th October, 1919?"—Yes. Obviously if I had not given a memorandum of that sort the waggon superintendent at Clyde would have asked him, "What are you doing here?"

40. *Mr. Dingle.*] Do you remember seeing me when I came to you from Mr. Warren?—Yes.

41. Did I make any reference to Mr. Starr meeting me there?—I cannot remember any detailed conversation so far back as that.

42. I will refer to a period further back. Do you remember meeting me with a deputation on the morning of the strike?—Yes, I remember you somewhere about that time.

43. Were you ever down at White Bay?—Many times.

44. Did you see the state of that yard?—Yes, I would notice the state of it.

45. *Mr. Ness.*] Was construction work going on there at that time?—Yes. Mr. Kendall was just taking over what was known as the old iron or steel works.

46. Do you remember Mr. Melville reporting at your office the words I said to him?—No.

47. Was the burying of material in Alexandria yard known to you?—No.

48. Would you be surprised to learn that material is buried there, also under the shops recently erected there; do you know what the shops are built on?—They are built on the formation of the earth embankment.

49. You are positive of that?—Yes.

50. *Mr. Ness.*] A complaint was made by Mr. Starr to the Commissioners that certain material was buried. Certain prospecting took place. Do you know if anything was found?—No.

51. *Mr. Dingle.*] Is it a fact that my reports were sent to the heads of other branches of the railway service?—I cannot answer that question definitely, but I have an impression that on one or two occasions extracts may have been sent to other branches. I do not recollect whether they were or not. I think that where some matters were mentioned in your reports which obviously related to other branches I sent extracts from your reports to those branches.

## LEGISLATIVE ASSEMBLY.

## NEW SOUTH WALES.

## UNIFORM RAILWAY GAUGE.

(EXPLANATORY MEMORANDUM RELATING TO THE REPORT OF THE CONFERENCE OF COMMONWEALTH AND STATE MINISTERS (1923) UPON THE PROPOSED UNIFICATION OF AUSTRALIAN RAILWAY GAUGES, PARTICULARLY IN REGARD TO THE KYOGLE-BRISBANE RAILWAY.)

*Ordered by the Legislative Assembly to be printed, 16 October, 1924.*

## Statement for the Premier's use in the Legislative Assembly.

## Uniform Railway Gauge.

MR. HORSINGTON asked me on Tuesday night a question regarding the unification of the Australian Railways and the ratification by Parliament of any proposals in connection therewith.

The report of the Conference of Commonwealth and State Ministers held in May and June, 1923, was tabled on 6th September of that year. It will be observed from pages 101 *et seq.* that the Royal Commission on Uniform Railway Gauge which reported on 22nd September, 1921, recommended the making of provision for:—

- (a) A 4 ft. 8½ in. gauge railway from Fremantle to Kalgoorlie, linking with the existing railway from Kalgoorlie to Port Augusta;
- (b) A 4 ft. 8½ in. gauge railway from Port Augusta to Adelaide (part conversion);
- (c) Conversion of the whole of the 5 ft. 3 in. gauge line of South Australia and Victoria (including the conversion of the 3 ft. 6 in. line between Terowie and Peterborough in South Australia);
- (d) A 4 ft. 8½ in. gauge railway linking Sydney and South Brisbane *via* Macksville, Kyogle, and Richmond Gap.

The estimate for this scheme is £21,600,000 made up as follows:—

	£
(a) Alterations to existing railways and structures...	9,012,000
(b) Any new lines necessary ...	6,873,000
(c) Adjustments of rolling-stock ...	5,715,000
<b>Total</b> ...	<b>£21,600,000</b>

These recommendations were considered at a conference of Premiers with the Prime Minister in Melbourne in November, 1921, when it was resolved:—

That the adoption of a uniform gauge is, in the opinion of this Conference, essential to the development and safety of the Commonwealth.

That the Commission's recommendation of a 4 ft. 8½ in. gauge be accepted.

That the Commonwealth shall prepare and circularise to the States a draft agreement to give effect to the recommendations of the Commission.

That steps shall be at once taken by the Premiers of all the States to consult their Governments with regard to the said agreement, and the financial obligations of the parties thereunder, and that the conclusions arrived at shall be communicated to and considered at a further Conference in January, 1922.

The further Conference was held in Melbourne on 17th and 18th January, 1922, and no decision was arrived at.

The Commonwealth Government, as a result of reconsideration of the position, submitted an alternative scheme for the consideration of the States at the 1923 Conference. In view of the financial situation the Federal authorities believed that adding to the already high interest charges on the existing lines was inadvisable, especially in view of the fact that the expenditure involved in the scheme previously submitted would not, to any extent, aid in the development of new country, which was a matter of such vital importance to Australia, particularly in regard to the migration schemes of the Commonwealth.

The following alternative scheme, which would promote development of new country and would largely minimise the existing difficulties in connection with the breaks of gauge, and would not in any way conflict with the larger scheme of unification should such be agreed upon at any time, was therefore suggested by the Commonwealth for the consideration of the State Governments:—

1. That a 4 ft. 8½ in. gauge line be constructed between Port Augusta (South Australia) and Hay (New South Wales).
2. That a 4 ft. 8½ in. gauge line be constructed between Kyogle (New South Wales) and Brisbane (Queensland).

The approximate costs of the above proposals are as follow:—

	£
1. Port Augusta to Hay (500 miles) ... ..	4,500,000
2. Kyogle to Brisbane (87 miles), including strengthening of existing line between Grafton and Kyogle ... ..	3,500,000
Total ... ..	£8,000,000

As a result of the opposition of South Australia and Victoria the Commonwealth proposals were not adopted. The Minister for Public Works and Railways for New South Wales stated that the New South Wales Government was practically agreed regarding the cross-continent connection, the only difference being that it considered the country would be better served by the completion of the line to Broken Hill which had been three-parts constructed, than by the construction of a standard gauge line between Port Augusta and Hay. Mr. Ball pointed out that the development of the Murray Valley had already been provided for by the Border Railways Agreement between Victoria and New South Wales under which no fewer than four railways were being built into Murray lands, and four bridges were being constructed over the Murray River.

As New South Wales, Queensland, and the Commonwealth were prepared to proceed with the construction of the Brisbane to Kyogle line, the Prime Minister stated that he would subsequently confer with the Governments of the two States mentioned, with a view to seeing whether action could be taken to carry out that section.

It is understood that the Commonwealth Government is now in negotiation with the Government of South Australia regarding other sections.

The Acting Premier of Victoria stated at last year's Conference that his Government could have understood the Commonwealth proposing a line from Trida to Menindie.

## COPY OF COMMISSION.

GEORGE the Fifth, by the Grace of God, of the United Kingdom of Great Britain and Ireland, and of the British Dominions beyond the Seas, King, Defender of the Faith, Emperor of India.

To our Trusty and Well-beloved,

SIR SAM FAY, K.T., J.P.,

SIR VINCENT RAVEN, K.B.E., M.INST.C.E., M.I.M.E., M.I.E.E.—

## GREETING :

KNOW YE, that We, reposing great trust and confidence in your ability, zeal, industry, discretion, and integrity, do, by these presents, with the advice of our Executive Council, authorise and appoint you to inquire into the management, equipment, and general working, including the finance, administration, control, and economy of the Railway and Tramway Services in New South Wales, and more particularly :

- (1) The organisation and running of the passenger and goods traffic, the services rendered, the scales of fares and freights operating, and the financial returns.
- (2) Matters appertaining to the organisation and conduct of the Mechanical Section of the system in relation to the respective types of locomotives and rolling-stock adopted, cost, economy of life and use, equipment, renewal, and maintenance charges.
- (3) Matters relating to the construction, renewal, and maintenance of the permanent way, including station equipment and the systems of signalling and interlocking adopted.

AND WE DO, by these presents, give and grant to you, or either of you, full power and authority, with all proper or necessary assistance at all times, to call before you all such persons as you may judge necessary, by whom you may be better informed of the truth of the premises, and to require the production of all books, papers, writings, and other documents as you may deem expedient, and to visit and inspect the same at the offices and places where the same or any of them may be deposited, and to inquire of the premises by all lawful ways and means. AND Our further will and pleasure is that you do, within the space of six months after this, Our Commission, or sooner if the same can reasonably be done, certify to Us, in the office of Our Premier, what you shall find touching the premises. AND WE HEREBY command all Government officers, and all other persons whomsoever within Our said State, that they be assistant to you in the execution of these presents. AND WE DECLARE this, Our Commission, to be a Commission for all purposes of the Act No. 29 of 1923, intituled "The Royal Commissions Act, 1923."

IN TESTIMONY WHEREOF We have caused these Our Letters to be made Patent, and the Great Seal of Our State of New South Wales to be hereunto affixed.

WITNESS Our Trusty and Well-beloved SIR DUDLEY RAWSON STRATFORD DE CHAIR, Admiral in Our Royal Navy, Knight Commander of Our Most Honorable Order of the Bath, Member of Our Royal Victorian Order, Governor of Our State of New South Wales and its Dependencies in the Commonwealth of Australia, at Sydney, in Our said State, this ninth day of May, in the year of Our Lord one thousand nine hundred and twenty-four, and in the fifteenth year of Our Reign.

(Sgd.) D. R. S. DE CHAIR,  
Governor.

By His Excellency's Command,  
(Sgd.) GEORGE G. FULLER.

Entered on Record by me, in REGISTER OF PATENTS, No. 40, page 13, this twenty-sixth day of May, one thousand nine hundred and twenty-four.

FOR THE COLONIAL SECRETARY AND REGISTRAR OF RECORDS,

(Sgd.) E. B. HARKNESS,  
Under-Secretary.  
per H.D.

# ROYAL COMMISSION ON RAILWAYS AND TRAMWAYS.

## REPORT.

To His Excellency Sir DUDLEY RAWSON STRATFORD DE CHAIR, Admiral in the Royal Navy, Knight Commander of the Most Honorable Order of the Bath, Member of the Victorian Order, Governor of the State of New South Wales and its Dependencies, in the Commonwealth of Australia.

MAY IT PLEASE YOUR EXCELLENCY,—

1. We, your Commissioners, appointed to make a full inquiry into the finance, management, equipment, and general working, including the administration, control, and economy of the railway and tramway services in New South Wales, and more particularly—

- (a) The organisation and running of the passenger and goods traffic, the services rendered, the scales of fares and freights operating, finance and financial returns,
- (b) Matters appertaining to the organisation and conduct of the Mechanical Section of the system in relation to the respective types of locomotives and rolling-stock adopted, cost, economy of life and use, equipment, renewal and maintenance charges,
- (c) Matters relating to the construction, renewal, and maintenance of the permanent way, including station equipment and the systems of signalling adopted,

have the honour to submit the following report :—

### I.—INTRODUCTORY.

#### Appointment of Royal Commission.

2. The appointment of a Royal Commission was announced by the Premier on the 22nd December, 1923, the members being Sir Sam Fay and Sir Vincent L. Raven, to whom your Commission was issued on the 9th May, 1924, authorising and appointing those Commissioners to inquire into the above-quoted subjects.

3. The appointment of this Royal Commission was the result of discussions in the Legislative Assembly upon railway administration generally, including the reappointment or otherwise of the present Railway Commissioners. As a temporary arrangement, and pending the report of your Commission, the services of the Railway Commissioners were extended until 31st December, 1924.

#### Conduct of the Inquiry.

4. Your Commissioners arrived in Sydney on 9th May, and immediately proceeded to issue a questionnaire of sixty items (subsequently amplified) through the Minister for Railways to the Railway Commissioners. Statements were also obtained from the same source as to the duties of the various chief officers, and the general organisation and administration of their branches. We have also called for, and perused, the Minutes of the Board Meetings of the Commissioners, the Committee Meetings, and the various Officers' Conferences, and have also analysed the complaints, numbering some hundreds, addressed to the Railway Commissioners by the public over a period of six months. In conjunction with our personal observations, these have probably given us as much information on the subject of the New South Wales Railways as the evidence placed before us.

5. Commencing on 13th May, we travelled over the whole of the main lines, and, with few exceptions, the branch lines, of the New South Wales State railway system. We devoted thirty-six days to the tours of inspection, travelling 9,580 miles in that period, and inspecting the plant and facilities. In the course of these tours, which

were

were undertaken primarily to enable us to become acquainted at first hand with the location, general layout and equipment of the track, stations, and buildings, we ascertained the traffic conditions of the lines, the facilities provided for the handling of various classes of traffic, the nature of the country served by the railway network, and the methods of local supervision and working. To this end an inspection was made of passenger and goods stations, refreshment-rooms, locomotive and electrical workshops, sheds, and manufacturing establishments, stores, yards, signalling equipments, and the permanent way, together with other essentials of railway service, while conversations with the local supervisory officials helped us to appreciate the nature of the railway problem in this State. These tours of inspection also enabled us to study the detailed organisation of the various districts on the spot.

6. With the exception of a tour to Broken Hill and an inspection of the lines in the Riverina area, we were accompanied—at our own request—by Mr. J. Fraser, C.M.G., Chief Railway Commissioner, in order that we might have the advantage of ascertaining at first hand such information upon the layout of the lines and various phases of railway working as we required. The Chief Traffic Manager, the Chief Mechanical Engineer, and the Information Officer also accompanied us, while traffic and locomotive officers were present in their respective districts for the purpose of explaining the various features of the railway system in their areas.

7. The tours of inspection were completed on 11th July, and at intervals between journeys evidence was taken on oath from the Commissioners, the principal officers of the Railway Department, and also from Mr. F. A. Coghlan (Auditor-General), Mr. E. J. Sievers (Valuer-General), Mr. J. Spencer Watts, of Messrs. Smith and Johnson, Public Accountants, Sydney, who made a report to the Railway Commissioners in 1921 upon finance and financial methods, and Mr. J. Spence, Director of Finance at the Treasury.

8. Regular sittings were commenced in Sydney on 15th July, and one day's hearing took place at Newcastle on 20th August. Evidence was taken on twenty-eight days. In all, twenty-eight departmental officers and twenty-five representatives of public bodies and associations were heard in addition to the gentlemen named above. The list of witnesses is given in Appendix 3.

9. It became evident at an early stage of the inquiry that the system of financial control under which the railways and tramways are dependent upon the yearly budget of the State, coupled with the fact that no reserves exist to meet wasting assets, dominated the organisation, and through it the efficient and economical operation of the transport services. We have, therefore, placed Finance and Financial Control in the forefront of our report.

10. Summarised, the Terms of Reference fall into five main heads, as shown below, and we deal with them in that order:—

#### FINANCE AND FINANCIAL CONTROL.

#### ORGANISATION.

#### MANAGEMENT.

- (a) Permanent Way and Works,
- (b) Signalling,
- (c) Mechanical.
- (d) Electrical.
- (e) Stores.
- (f) Operation.
- (g) Rates and Fares.

#### TRAMWAYS.

#### MISCELLANEOUS QUESTIONS.

A final section contains a Summary of our principal Recommendations.

#### Railway Development in New South Wales.

11. The first attempt to introduce railway communication in New South Wales was in 1846, but it was not until 1848 that a company entitled The Sydney Tramroad and Railway Company was formed for the purpose of constructing a railway from Sydney to Parramatta and Liverpool, with possible future extensions to Goulburn and Bathurst. This company, however, made very slow progress with the work, which was ultimately taken over by the Government. Meanwhile, another company had been started in 1853 with the object of constructing a railway from Newcastle to Maitland. This was no more successful than the Sydney company, and shared the same fate.

12. The Government, on taking possession of the property of the defunct companies, carried on the works with energy and on 26th September, 1855, opened the line from Sydney to Parramatta, while communication was established between Newcastle and East Maitland on 11th April, 1857. Thus, practically from the inception of railways, the Government has managed and operated the railway transport services and now, except for a few short private lines, the whole of the system in New South Wales is State-owned. In the first decade after the opening of the Parramatta railway, 129 miles were built, in the second decade, 294 miles, and in the third, 1,295 miles of construction took place. From 1885 to 1895, 799 miles were added. Railway development rapidly proceeded, and during the eleven years from 1914 to 1924, the route mileage actually increased by over 39 per cent.—from 3,967 route miles to 5,523 route miles.

13. The Statutory relations between the Government and the railways, as contained in various Government Railway Acts, provide for the appointment by the Government (*i.e.*, by the Governor with the advice of the Executive Council) of Commissioners as a corporate body under the name of "Railway Commissioners for New South Wales." For the purposes of the Acts the railways and tramways (including equipment and lands are "vested absolutely" in the Commissioners. They are authorised to work and manage the railways, but their powers are circumscribed in several important respects. Expenditure is limited to moneys appropriated by Parliament, and all receipts are to be paid into the Consolidated Revenue of the State day by day. Moneys for additional stores, plant, rolling-stock, stations or other accommodations considered necessary to meet traffic requirements have to be sought by application through the Minister for Railways. Approval of by-laws must be obtained and as rates and fares are imposed by by-law this entails a submission to the Government of any proposed increase or decrease in charges. Examiners of candidates for permanent employment in the Railway Service have been appointed by the Chief Commissioner. An Appeal Board to deal with appeals by the staff against punishments must have a Chairman appointed by the Government. All regulations as in the case of by-laws must receive Executive authority before becoming operative.

#### Important Facts and Figures.

14. Prior to the detailed consideration of particular questions, it will probably be of advantage briefly to outline the salient points of the railway system and the financial results of the New South Wales Government Railways Undertaking over the past few years. Comparisons over the period of eleven years are included in this review, but it must be observed that such comparisons should be regarded with caution, owing to the disturbing effect of the war period vitiating the accuracy of conclusions drawn wholly upon the figures here presented. The unification of accounts on the railways of Australia in 1921 also led to certain changes in the methods of calculating figures, and this is a further complicating factor. We give the figures, which are extracted from the annual reports, in order to show to some extent the nature of the problem with which we were confronted on our arrival.

15. At 30th June, 1924, the New South Wales Government Railways open for traffic represented a capital of £93,355,167; this being divided as follows:—

#### RAILWAY CAPITAL EXPENDITURE AT 30TH JUNE, 1924.

1. Acquisition of land, property, &c., used in connection	£
with railway working (approximate) ... ..	4,243,659
2. Construction of lines and works open for traffic ... ..	67,945,357

16. The New South Wales railways extend from Albury, Tocumwal, and Bombala in the south to Wallangarra and Murwillumbah in the north, a distance of 900 miles. The most distant western terminals are Hay, Trida, Bourke and Brewarrina, these ranging between 470 and 522 miles from Sydney. There are two isolated sections, one at Broken Hill and the other along the North Coast, the latter being cut off from the rest of the system by the Clarence River at Grafton.

17. The system comprises 5,523 route miles of lines, of which 4,875 are single track, and represented 6,261 track miles on 30th June, 1924, this comparing with 3,967½ route miles and 4,403¾ track miles at 30th June, 1914, increases of 39 per cent. and 42 per cent. respectively. During the year ending 30th June, 1924, the Railway Department carried 117,356,316 passengers on the suburban services and 10,744,868 on the country services, these figures comparing with 77,431,809 and 8,896,612 respectively in the year 1913-14. The corresponding figures for freight traffic (goods, coal, coke and live stock) were 15,693,127 for the year ending 30th June, 1924, and 13,245,842 tons for the year ending 30th June, 1914.

18. The total revenue for the year 1923-24 was £15,616,577, and the working expenditure £10,917,491, thus leaving £4,699,086 net revenue to cover the amount required to meet interest obligations. Ten years ago, the corresponding figures were £7,742,241 earnings, £5,409,820 working expenses, and balance after paying working expenses, £2,332,421. The percentage of working expenses to receipts for the two years in question was 69·91 and 69·87 respectively.

19. The brief summary in the preceding paragraphs clearly indicates that considerable development has taken place in the last decade, and while in the course of the ten years, largely owing to the incidence of the war, there have been variations in development, it is to be noted that since 1913-14 capital expenditure has increased 52 per cent., revenue 102 per cent., working expenses 102 per cent., and interest payments 121 per cent.

Twelve Months ended 30th June.	Total Railway Capital Expenditure.	Gross Earnings.	Working Expenses.	Net Earnings.			Per cent. of interest on State Loans attributable to Railways.
				Amount.	Per cent. of Profit to capital invested.	Surplus or deficit in interest on State Loans.

## II.—FINANCE AND FINANCIAL CONTROL.

### Commissioners' and Treasury Capital Figures.

20. In reviewing the financial position of New South Wales railways, a difference presents itself as between Railway and Government figures by reason of the fact that the capital assumed by the Railway Commissioners refers to lines open for traffic only, whereas Treasury accounts include moneys spent on lines under construction, interest upon which is not charged against railway administration until completion and the opening of lines for traffic. At 30th June, 1924, the capital commitment in railways and works open for traffic was £93,355,167. At the same time the State indebtedness upon those lines and works, plus lines under construction, totalled £98,851,357. There is roughly £104,000,000 sterling (including tramways) represented in the loan account of the State out of a total of £210,493,974 resting upon the Consolidated Revenue Fund.

21. In sixteen years, viz., since 1908, the railway capital account has been doubled, and since July, 1913, there has been an addition of £35,701,389, or 62 per cent., whilst mileage of line increased by 41 per cent. during the same period. The railway capital, revenue, expenditure, and interest figures from July, 1913, to 30th June, 1924, are given in the preceding table, while the diagrams on pages x and xi show how the revenue was earned and how it was spent in 1913-14 and 1923-24.

### Interest Charged to Railway Account.

22. Over these years the deficiency in net revenue necessary to meet interest charges upon that portion of the Consolidated Loan Account of the State attributable to railways totalled £1,410,106, and it will be observed that only in the years 1914, 1923, and 1924 was there a surplus over and above the interest charges.

23. In this connection it is well to note here that the Railway Commissioners are not altogether satisfied that the interest charged by the Treasury to their account has been strictly correct. Mr. Hartigan, the Chief Accountant, in answer to the query (Q. 1): "Does the interest on capital represent the actual rate at which moneys for railway purposes was raised?" said "No. The interest is calculated on the capital invested at the average rate of interest paid on the whole of the State loan. The Railway Commissioners are advised of this rate by the Treasury, but have no means of checking the correctness thereof." He said further (Q. 37) "I have never been able to ascertain how the average rate is computed. The Treasury advises us of the average rate, but I personally doubt whether that rate is correct. It is questionable whether we are not being overcharged by too high a rate." It is very desirable that this point should be cleared up.

24. The figures tabulated in the preceding table bear the impress of the war directly and indirectly. Increase in the purchase price of coal and materials was £1,095,000, municipal and water rates account for £58,000, while wages—increased to meet the enhanced cost of living and reduced hours of work—represent over £3,105,000 of the difference between the 1914 and 1924 expenditure. How serious is the burden upon the railways of the rising rate of interest on the State debt is shown by the figure of 3·6685 per cent. in 1913-14 and 5·1606 per cent. in 1923-24. The actual cash difference under this head between the two years is £1,357,000. We deal elsewhere with the war effect upon the rolling-stock, and also the disturbance of the suburban electrification programme. We might, however, add that the adverse effect of the war upon railways generally would appear from these figures to have been less in Australia than in many other countries of the world.

### Capital Expenditure Charged to Working Expenses.

25. The working expenses shown in the facing table include certain items, properly chargeable to capital, estimated at £80,000 per annum. In theory, the necessary renewals are included in the working expenses, but no provision has been made for meeting wasted and wasting assets year by year, and there is no reserve of any sort for renewals.

### Provision of Funds.

26. The manner in which railway funds are provided follows British Budgeting methods. Some time before the end of the financial year, the chief officers

officers prepare estimates of expenditure on capital and revenue accounts for the coming financial year. The Chief Commissioner criticizes these estimates, together with the estimates of prospective revenue, and submits them to the Minister for Railways, who sends them on to the State Treasurer for later submission to Parliament. Mr. Fraser's evidence (Q. 158) upon this aspect of the question was to the effect that the departmental estimates of expenditure required, both on loan and revenue accounts, have generally been greater than the amounts which the Government has been able to provide, and expenditure in both connections has, therefore, been restricted to the lowest possible minimum.

27. In answer to a written request for further information, Mr. Fraser furnished a paper stating that "The Loan Estimates, upon submission to the Treasurer, were always returned to the Commissioners with an intimation that a certain sum only would be made available for their requirements. A stated amount must be allocated for new lines construction. As a consequence, the original loan programme had, of necessity, to be revised, and many urgent and necessary works deferred, while others in progress had to be stopped until funds were made available." Mr. Fraser further said that "he had to have regard to what it was possible or practicable to spend in relation to the revenue likely to be received, and the interest which must be met during the year." On this subject, the following extracts from letters to the Minister for Railways dated 16th August, 1919, 27th April, 1920, and 26th April, 1922, are illuminating.

16th August, 1919.

In reply to your communication of the 11th instant intimating the views of the Minister for Works and Railways, with regard to the Loan Estimates submitted by the Commissioners for the current financial year, I am directed to say that, as desired, the various items for which provision was made in the Loan Expenditure have been further considered by the Commissioners, who regret that they are unable while considering the urgent requirements of the community to reduce the amounts set down for the various works proposed.

Firstly it should be taken into consideration that the amount of work which can be produced for a given sum will be lower during the current financial year than during any previous period in which records have been kept owing to the higher wages now being generally paid, and to the high value at which the cost of materials is still maintained.

You question the possibility of the money asked for being expended, and in this connection I might point out that in some years before the war greater expenditure relatively was incurred than that proposed for the present year while the business to be catered for was less. In the year 1913 the total amount expended for rolling-stock and additions to lines, duplications, &c., was £2,772,030, but the work then carried out for that sum could not be carried out during the current year for a less sum than about £4,500,000. Similarly in the year 1914 works costing £3,485,279 were carried out under the headings abovementioned. To carry out a similar amount of work to-day would cost about £5,500,000. It would appear, therefore, that as the Department was able prior to the war to, without material difficulty, expend the large sums of money mentioned, there should be no difficulty with better appliances in completing works to the amounts provided on the Estimates for the current year.

Incorporated in the amount for rolling-stock are vehicles most urgently required in the handling of the passenger business of the City, and urgently required to permit of the carriage of all the products of the State which may be offered for transport, and I am desired to stress the importance to the community of the provision of adequate rolling-stock to permit of workers in the State to produce from day to day and transport from day to day the maximum tonnage practicable, as only in this way will the financial position of the State be greatly bettered.

The Commissioners believe that the proper equipment of existing railways to enable the daily business to be satisfactorily carried on is a matter of greater urgency than any other work or works which could be submitted, for the reasons stated, i.e., that the financial position of the State depends upon maximum production, and maximum production cannot be achieved if the transport services are in any respect inadequate. To make this service adequate in all respects, rolling-stock which has been referred to in special communications must be provided, and the facilities for dealing with that rolling-stock at certain stations throughout the system where serious congestion at present exists are practically equally urgent.

There is, in addition, necessity for the housing of large numbers of the staff to prevent the serious grievance which frequently arises from the discomforts endured owing to lack of suitable accommodation. The provision of such residences will probably tend to produce greater contentment, and contentment is an essential condition to the satisfactory working of any business.

With regard to the duplication of the lines, I am directed to intimate that the completion of the works on the Illawarra Line as between Tempe and Rockdale, between Otford and Coalcliff, and between Thirroul and Wollongong, are essential to permit of the reasonably satisfactory working both of the suburban passenger business, and the heavy mineral business which is derived from that line. The work between Bowenfels and Wallerawang is also of an urgent character owing to the difficulties in operation which occur when the business is at all heavy, and a very considerable amount of the business being now a mineral business this will remain heavy despite weather conditions.

On the main Southern Line there is a weak link between Murrumburrah and Demondrille Creek, to which is due frequent irregularities and difficulties in working the heavy through business which occurs during good seasons, and also in bad seasons when live stock is being moved from place to place.

With

## XV

With regard to the amounts required for Tramways, the largest item of expenditure is the sum required to complete the erection and equipment of the new power-house at Newcastle, which work is in progress, and which should be completed at the earliest possible date.

The additional amounts suggested by the Minister have been added to the Loan Estimates, although the Commissioners are not aware of any urgent works demanding the expenditure suggested.

The Commissioners note that it is not the Government's wish that active commencement be made with works in connection with the City Railway during the current financial year, and desire me to say that the transport facilities in this City are now in such an unsatisfactory position that the decision of the Cabinet to defer for a further twelve months the commencement of the only work which can give the required relief is a decision of very grave moment to the city and suburban population, and a decision which the Commissioners think should have the most earnest reconsideration by the Cabinet before confirmation, and it is hoped is only a tentative resolution in this connection.

The suggestion of the Minister with regard to the expenditure on the Molong to Dubbo connection can perhaps be met if labour offers to a sufficient extent to enable the whole of the railway construction work being properly proceeded with, and the Commissioners are submitting a revised proposal in connection with railway and tramway construction in conformity with the Minister's desire. To accelerate the work on the Sydenham-Botany line, owing to the fact that it must be nine to twelve months before a quite considerable number of bridges on this line can be completed (owing to material having to be imported from England), the ultimate cost of the work will if now taken in hand for the speediest possible completion, be considerably increased beyond the estimate for the work previously furnished, owing to the fact that a very great deal of the earthwork on this line is filling to embankments of considerable magnitude, and that filling must be conveyed over various streets crossed on temporary bridges which will entail quite a considerable expenditure. From the point of view of economical construction the preferable course would be to complete the bridges and use them for the transport of the material required for main line construction. However, as the work is urgent, the desired acceleration could be given.

27th April, 1920.

I mentioned to you a few days ago that this Department has had to conduct its services under very serious difficulties for some years past, owing to the fact that funds have not been made available to provide necessary equipment and accommodation, and you were good enough to ask that I should set out the position so that consideration might be given by Cabinet to matters which are deemed important. Difficulties in working would naturally be due to lack of—

1. Rolling-stock,
2. Shop or shed accommodation,
3. Track,

and I will deal as briefly as possible with these matters under these headings.

#### Rolling-stock.

Complaints are made daily, particularly by the residents of the suburbs of this city with regard to the overcrowding of suburban trains and trams, but the remedy for such complaints must be a more drastic one than the mere provision of additional passenger cars steam operated, though pending the construction of city and suburban electric railways, additional cars hauled as at present must be put into service. The position with regard to rolling-stock generally in comparison with the business done is disclosed in the appended table:—

Year.	Passengers Carried.	Ton Miles (Goods).	Engines (No.).	Carriages (No.).	Wagons (No.).
1898 ...	23,233,206	273,400,624	498	736	9,442
1908 ...	47,487,030	617,642,314	676	937	12,110
1919 ...	98,568,768	1,237,805,869	1,280	1,795	20,798

It will be seen that though the business was about four and a half times as great in 1919 than in 1898, engines, carriages and wagons were only slightly more than doubled in number, and similarly while the business in 1919 was double that done in 1908, engines, carriages and wagons increased relatively 88 per cent, 90 per cent., and 71 per cent.

It is true that the outbreak of war made it impossible to get material for the construction of rolling-stock, and there are still serious difficulties in obtaining such materials, while prices are approximately 200 per cent. above pre-war rates. Yet it is clear that the Government must view favourably the necessity for providing funds for this work, or embarrass seriously the transport of the travelling public, and of the material produced in and required by the people of the State as a whole.

#### Shop and Shed Accommodation.

Some years ago the attention of the then Government was drawn to the need for additional workshop accommodation to provide adequately for the maintenance of the additional rolling-stock then in use, and the position has since become more acute. The present repairs shops at Eveleigh were erected about thirty-four years ago for the maintenance of 426 engines and 600 carriages, and without material additions are called upon to-day to maintain 1,300 engines and 1,795 carriages, and as already shown by the table which shows the increase in business each engine and each carriage has double the work to do than was done per unit when these shops were erected. Similarly in connection with country running sheds and carriage sheds, while the number of engines and carriages has more than doubled in the past twenty years, shed accommodation has been added to, to cover only a very small percentage of that increase.

#### Track Accommodation.

During the period between 1910 and 1916 running track was materially added to and additional working track provided at a few depôt stations, but at a great number of important depôts where the business has enormously increased there has been no addition either to track or other facilities for conducting that business.

In

In the foregoing I have briefly mentioned some of the greater matters for which money will be required, and have included information with regard to the business done in relation to the rolling-stock and equipment which should demonstrate that the allocation of funds to provide more adequately for the work is a matter of urgency. I have not specifically mentioned loco. water supplies, many of which are entirely inadequate for present business, nor have I included in the above reference to the present need for additional tramway rolling-stock, or the electrification of tramways now steam operated. External pressure may be brought upon you with regard to the latter, and the need for additional tramcars in the city is obvious.

My chief desire for the moment is to show that money is urgently required to satisfactorily equip existing railways; the construction of new lines, and the partial isolation of rolling-stock upon such lines must accentuate present working problems, and as it is I understand the policy of the present Government to rapidly complete railway extensions now in hand, it will, I trust, be your policy also to provide that equipment for existing railways without which the business cannot be much longer carried on.

26th April, 1922.

I attach, for your information, copy of a letter which I addressed to your predecessor on the 27th April, 1920, indicating to him certain difficulties under which the work of this Department was then being conducted owing to the lack of rolling-stock, to lack of suitable shops and equipment for the maintenance of rolling-stock, to lack of accommodation at certain of our larger depôts for the proper conduct of our business, and, although this point was not elaborated upon, to the serious lack of suitable water supplies for locomotive purposes throughout the State. I have to request that you might read the letter in question, and would like to submit certain further figures which demonstrate that this Department has been called upon for years past to conduct the railway and tramway services with totally inadequate facilities. It is true that we have carried on the transport services and have effected savings which may be termed colossal by demanding and getting increased efficiency in every branch of the Department, but the time is approaching, and is indeed very near, when with our present rolling-stock and present accommodation at various places for dealing with the purely departmental end of the business, we will not be able to carry on.

#### Rolling-stock—Railways.

Dealing first with rolling-stock, the table hereunder shows the number of engines, carriages and wagons owned by the Department in 1914 and in 1921, in comparison with the actual work done in those years :—

	1914.	1921.	Increase per cent.
Railways—			
Goods ton miles—paying .....	1,037,910,619	1,418,385,987	37
Goods rolling-stock—			
Goods open .....	14,784	16,063	9
Goods covered .....	980	945	(dec.) 4
Meat trucks .....	344	428	24
Live stock .....	2,504	2,889	15
Brake vans .....	491	605	23
Total .....	19,103	20,930	9
Passengers carried—			
Suburban .....	77,431,809	110,255,795	42
Country .....	8,896,612	10,479,345	18
Total .....	86,328,421	120,735,140	40
Passenger rolling-stock—			
Special and sleeping cars .....	92	96	4
First-class .....	391	467	19
Composites .....	190	218	15
Second-class .....	805	961	19
Brake-vans .....	163	138	(dec.) 15
Horse boxes, &c. ....	281	289	3
Total .....	1,922	2,169	13
Engines .....	1,065	1,301	22

The work increased, as you will see, by about 38½ per cent., but the wagon stock was increased by only 9 per cent., passenger rolling-stock by only 13 per cent., and engines by only 22 per cent. That there must be considerable additions to the rolling-stock is obvious from these figures.

#### Tramway Rolling-stock and Work.

In 1914 approximately 261 million passengers were carried, and in 1921 the passengers carried totalled 278 million, an increase of 17 million. The tramway rolling-stock owned by the Department in 1914 was 1,469 cars, while the total number of cars in 1921 had decreased to 1,424. These figures show that the Department had to carry 17 million more passengers in 1921, with actually 45 less cars, these latter having gone out of service owing to their being unfit in every respect for the services which have to be given to-day.

Railway

## xvii

## Railway Track.

In connection with the track and railway construction generally, I pointed out to your predecessor that the mileage had increased from 1914 to 1921 by about 30 per cent., but the business had not increased in a relative degree. The following figures with regard to construction generally seem to me to be worthy of further close consideration by yourself and your colleagues :—

	1914.	1921.	Increase.	Percentage Increase.
Route miles of line .....	3,967	5,018	1,051	26
Population .....	1,868,000	2,100,000	232,000	12
Capital cost .....	£61,264,869	£82,304,194	£21,039,325	34
Tonnage of Goods .....	13,245,842	15,563,131	2,317,289	17

The fact that from 1914 to 1921 there was very little increase in goods business carried on the railways in comparison with the increase in mileage and railway capital, is to some extent explained by the fact that the mileage of line opened for traffic increased at a much more rapid ratio than the increase in population,

I give these latter figures for two purposes, viz., to show (1) that the population of the State is relatively much better served to-day by the provision of railways than has been the case at any time previously, and (2) that money has not been made available to a sufficient extent to enable equipment and appliances to keep pace either with the increase in mileage or the increase in work.

## Water Supplies.

With regard to water supplies, the position in this State, from a railway point of view, is most unsatisfactory. The quality of the water in all districts where the business is heavy is extremely bad for locomotive purposes, and the cost of boiler renewals owing to the corrosive and destructive effect of the only waters available is very great, and involves very heavy expenditure annually in repairs and renewals of boilers, which with better quality water could be very greatly reduced.

I mention these various points as briefly as possible so that you may possibly appreciate some of the difficulties under which we are working, and you may be able at a later stage to obtain sufficient funds to enable the position in respect of the various matters mentioned to be greatly improved.

28. From the letters reprinted above, and the general trend of the evidence we have received, it is evident that considerable pressure is brought to bear upon the Chief Commissioner to reduce estimates year by year in order to enable the Treasurer to produce a balanced State Budget, the inevitable result of State financial stringency. Railway expenditure and revenue looms largely in the Budget, the capital expenditure, as previously noted, accounting for nearly one-half of the total State indebtedness of, roughly, £210,000,000 sterling. From 1914–1924 inclusive the interest charges have increased by £2,570,363 per annum, and it thus becomes a vital consideration in the balancing of the State Budget as a whole. At Q. 369 Mr. Fraser produced a letter bearing upon the 1923–24 estimates, in which it is stated that the estimated revenue expenditure of all Departments of the State exceeded the revenue by fully £1,500,000, and that it would be necessary to reduce them by that amount.

## Waste due to Budgeting methods.

29. Another aspect of this question is the late passing of the Budget by the Legislative Assembly. Although the financial year begins on 1st July, authority for working on the estimated basis is not given, as a rule, until October or November, the result being that in many instances moneys voted cannot be spent between the time of approval and the following June. Until the Budget is passed, Departments are debarred under the Audit Act from spending more month by month than they did on the average during the previous year. Thus, as Mr. Fraser properly said (Q. 375) : “Taken in conjunction with communications of the kind I have just read, it has a deterrent effect in connection with the mapping out of a programme of expenditure during a given year. No one in an administrative position can lay out a programme of expenditure for a whole year unless he knows that the money will be made available to spend, because if you are mapping out a programme for twelve months, you really want to begin to spend on the first day of that twelve months and continue your expenditure fairly consistently throughout the whole period. That is a thing which the Railway Department has never been able to do, either from loan or on the working expenditure side.”

30. Mr. Hutchinson, Chief Engineer for Railway and Tramway Construction, replied in the negative to a question (Q. 1829) as to whether he gave a date for the completion of a new line. Asked why he did not (Q. 1830) he said : “Because you never know what money you are going to get or how long it will take you to complete.” The following questions and answers are also recorded.

Q. 1834.—What expenditure in your particular branch is there authorised within the next four or five years?—That is never known. I do not know to-day what amount of money I am going to get for this financial year which we have just commenced. It is impossible for anyone under the method of voting money to-day to lay down a fixed plan and arrange an organisation extending over, say, a period of two, three, or four years. It is quite impossible, because Governments change. Incoming Governments have different views about lines from other Governments, and the amount of money they vote depends just upon the will of Parliament.

Q. 1844. When it is decided that a new line shall be made in the country, is not a vote taken for your estimate of cost?—No; an Act is passed, but it does not follow at all that the line will be proceeded with at once—they might not even construct the line that is authorised by Act of Parliament. There are lines which have been authorised by Act of Parliament years ago which are not built to-day. Nor do they, when they put an Act of Parliament through, at that time raise the money for building the line. The process which is followed is—after the Act is passed the Minister will say to the Railway Commissioners, "We are going to place a certain sum of money this year on the Estimates, and we wish you to have that line started." That is the way the line is started, and only the particular amount of money is voted for that year.

Q. 1845. Apparently there is a committal by the Government more or less for an expenditure over the next few years of two or three million pounds at least?—To-day there are six lines for which there are Acts of Parliament. Presumably those lines will be built, but no instructions have yet been given to the Commissioners to build any of them. They run into a good deal of money.

Q. 1846. Upon which a good deal of money has been spent in survey?—Yes.

Q. 1847. Then what does it mean to you under the existing organisation; does it mean that when you have a railway half constructed you are suddenly told there is no more money available?—We have lines that we are finishing now that were closed down owing to the fact that there was no money to construct them. That, I think, was largely due to the conditions prevailing in war time. That would be rather abnormal, of course. But what does happen is, say I had a railway 50 miles to build at a cost of £300,000 or £400,000, I might be ordered to commence the construction of that, and on the vote £50,000 might be put down for the first year. That means that you cannot carry out your work in the most expeditious way or the most economical way, and that is one of the difficulties I always contend of carrying out the work by day labour, which is our principle to-day. If the line is let to a contractor the Government has to provide the whole of the money, otherwise the contractor would bring enormous claims if he was blocked, and quite rightly so.

Q. 1848. We have looked through some of the minutes which you have made from time to time at your monthly conferences, and of course we could not help being struck by some of the remarks which you have made. According to these minutes you have said from time to time that you could not economically carry out the work?—That is quite correct.

Q. 1849. And that you could have finished the lines very much earlier?—Yes.

Q. 1850. And have earned money by the railway, which was not possible because you were stopped for the want of money?—Yes.

Q. 1851. Does it mean that when you are stopped in that way you get rid of your staff?—No. If you have a line going on and you are so to speak dribbling through the work your organisation practically has to be the same, because you have to take the time and you have to look after the men, and you have to do everything. You might perhaps have a clerk or two less, but that is all. You have to have the engineers there, and you have to have your organisation. You will not have the number of labourers; of course you only keep the number of labourers on that you can afford to keep on—that you pay for doing the work.

Q. 1852. As far as your administrative staff is concerned, you have to keep them going; your overheads are the same?—Practically the same. You would not have quite such a large staff, but you would have pretty well near it.

Q. 1852A. With regard to your actual operating staff, those men would be got rid of—I mean your navvies?—Yes. I have two lines going on to-day. I got £50,000 last year for one of them and £83,000 for the other. I asked for a great deal more than that. During the last year I have limited the expenditure each month so as to keep within that at the close of the financial year just ended. That was not an economical way of doing it at all. If the Commissioners had been able to get it from the Government and had said to me "You go ahead as fast as you can; we will supply the funds," the lines would have been nearly finished, and economy would have been created in every way.

Q. 1853. So that it amounts to this, that the whole of your plant for the construction of your railway is lying dead, because you cannot construct continuously?—A good deal of it. As regards those two lines I mentioned, of course, I did not send the plant on to the job, because I knew the conditions when I was starting.

Q. 1853A. In your view would not it be more economical to wait until there was a certainty of getting the money and going straight ahead with the work?—My view is that it would pay the Government if they are short of money to say "We shall only begin the number of lines that we can finish, and that our money is capable of letting them go ahead at the fastest rate at which they can be done."

31. In the year 1923-24 it is to be noticed that, in accordance with Ministerial request of February last, the amount spent on electrification of suburban lines and other works was £661,000 less than the sum sanctioned under the Budget.

32. Dr. Bradfield, Chief Engineer for Metropolitan Railway Construction, gave the following evidence:—

Q. 1883. Have you made any progress plan of the construction of the City Railway?—Showing the work from month to month?

Q. 1884. Showing when you are going to finish?—That depends upon when the money is made available.

Q. 1885. Did you make the estimate for the railway?—Yes, originally.

Q. 1886.

Q. 1886. When you made the estimate did not you anticipate a date?—We anticipated being able to finish the work in five years.

Q. 1887. That is to say, your estimate was based on the time it would take you to finish the construction on an economical basis?—Yes.

Q. 1888. I presume that your estimate was more or less an economical one based on time?—Yes.

Q. 1889. I gather from you that you do not anticipate finishing to time?—No. We have not the money available to start on the western side of the City. The money so far available is to go on to St. James's and open up to there.

Q. 1890. Have you up till now been held up for money?—To this extent: We asked for a certain amount of money. This year I asked for about £900,000. I am going to London on Wednesday. I do not know how much has been made available, and probably the office will not know for another two months, and probably the amount asked for will be cut down to about half; and, of course, you cannot prepare any scheme of work until you know what money is available.

Q. 1891. You started your financial year at the beginning of this month, and you will not know until the end of October or November how much money you can spend in the financial year?—That is from the 1st July to 30th June.

Q. 1892. How can you construct economically under such a system as that?—Of course, candidly we cannot. We do the best we can. We do not overload the staff in any shape or form; but I cannot expand the staff if we get more money available than we think will be made available until it is made available.

Q. 1893. It is quite possible that your date of five years may be seven?—It may be ten or twelve by the way it is going, with an estimated cost of  $4\frac{1}{2}$  million, and an expenditure of £360,000 a year.

33. It is abundantly clear that the loss to the State by reliance upon a yearly budget for construction of railways is very serious, how serious that loss is we have not been able to determine with any degree of accuracy. Loss is not limited to actual cost of lines, because delay in completion—due mainly to interrupted construction, in many cases repeated over and over again—involves a postponement of revenue from these new railways and there is, as a consequence, a burden upon the funds of frozen capital which, under business-like management, would have been avoided by rapid and continuous construction. Moreover, waste does not end with completion of the works, because waste of capital is reflected in the Loan Account, upon which interest has to be found by the Railway Commissioners year by year, and we thus have the spectacle of the Consolidated Loan Account being augmented each year by large sums representing not revenue-producing expenditure, but moneys thrown away because budgeting methods will not fit the requirement of a large commercial undertaking.

34. The evidence shows that, even with a Budget passed at the commencement of each financial year, loss would arise, but when the responsible engineers have to wait four months for knowledge of the amount allotted to each line, it becomes even more embarrassing and wasteful. In effect, it means only eight months of the year within which the engineers are safe in spending such moneys as the Budget gives them.

35. The Sydney Chamber of Commerce sent us the following expression of opinion:—

"(a) They consider the management of the New South Wales railways, as at present constituted, does not give the Commissioners the effective control of the railways which they should have. It is considered desirable that the State debt, incurred on behalf of the railways and the development of same, should be allocated as the capital of the railways, and separate stock—guaranteed by the State—issued for same. All future moneys raised for railway purposes should be by railway bonds guaranteed by the State.

"(b) That the Railway Commissioners publish a balance-sheet in the ordinary way as any trading concern, in fact, that the whole accounts of the railways be prepared and conducted on similar lines to those used by railway companies in other parts of the world.

"(c) That the Railway Commissioners, when the conditions described in (a) and (b) have been brought about, should provide primarily for a return on capital so as to cover the interest chargeable on the bonds which have been issued on behalf of the railways, and at the same time provide money for replacement and depreciation, and, to a certain extent, future extensions and improvements."

36. The Mayor of Newcastle, and General Paton, representing the Newcastle Chamber of Commerce, advocated the control of finance by the Commissioners.

#### Loss upon Developmental Lines.

37. The loss upon the working of developmental country lines has been the subject of a good deal of evidence, the equity of relieving the Railway Commissioners from any loss upon these lines, including interest on capital outlay, being stressed by representatives of various associations. It was urged that the country as a whole benefited by these railways and that, therefore, the loss should be borne nationally and not put upon that portion of the community who pay rates and fares. Sir Mark Sheldon (President of the Sydney Chamber of Commerce) said that the Government

Government should not have the right to order the Commissioners to build a developmental line unless they were prepared to guarantee the Commissioners against loss. Mr. Thorby (President of the Farmers and Settlers' Association) contended that Consolidated Revenue should stand the loss on such lines, and that some of the increased income accruing to the Lands and Forestry Departments should be credited to the Railway. Mr. Kidd (Vice-Chairman, Producers' Association Central Council) (Q. 3003) instanced the Wyalong and Lake Cargellico line where the Lands Department reaped a gain of £13,000 per annum by the presence of the railway, and the Railway Commissioners showed a loss of £8,000 upon the working of the branch line. He further pointed out that increased production meant increase in taxation paid through Income Tax Commissioners. He advocated an arrangement similar to that in Victoria, where railways are relieved of some portion of loss upon non-paying lines. He would not say that the making of any of the New South Wales lines was unnecessary, but the cost during a certain developmental period was, in his opinion, "out of place in the railway profit and loss account." Mr. Binnie (President of the Stockowners' Association) stated (Q. 3113) that:—

"The Dubbo to Werris Creek line has been urgently needed for the last thirty years by the stockowners as a stock-saving line in drought time. That line took ten years to build—about 156 miles of it easy country. The live stock lost during the last twenty years that this line would have saved would have paid for this line several times over. I have seen the wastage on this line which I think might amount to 50 per cent. of the cost; and our fares and freights must be calculated on it. The earthwork done has frittered away or been blown away; the effort has been desultory and scattered and without any co-ordination. I believe that material for the Werris Creek end of this line was taken away to another line, and I have heard that this has been done on every line in the course of construction; and material has been sent to jobs without relation to the different quantities balancing one another, *e.g.*, rails with shortage of sleepers or of fish-plates or of bolts. The patchwork system of construction is a heavy strain on the taxpayer—the capital outlay for years being without use of earning power. I should like to quote briefly from *Hansard* of November last, at page 2113—it is on the Dorrigo railway, referring to the repair of damages on unfinished lines: 'On the Dorrigo railway it has amounted to £150,000. What expenditure was incurred in connection with the repair of damages I do not know, but it can safely be said that the wastage on this line amounts to anything up to £300,000, the greater part of which is directly chargeable to damages, most of which would have been avoided had the line been pushed through as other lines have been. The cost of repairing damages, wiping off depreciation, and meeting interest, is nearly as much to-day as the estimated cost of the line.'"

38. The Commissioners' report for 1923-24 gives £1,207,824 as the loss, including interest, upon certain lines, but no credit is given in arriving at that figure for earnings upon main lines from interchanged traffic. Of these lines, 2,026 miles have been opened for traffic during the past ten years, and upon them the capital is given as £16,645,839, and the loss in 1924 £592,324. It is obvious that these figures do not represent the value to the State of the penetration of the interior by new lines, inasmuch as the augmented value of Crown lands and forests, and the increased taxable income, not only adjacent to such new lines, but generally throughout the State, is absent from the Commissioners' accounts. We are of opinion that some share of these revenues should inure to railways opened within a period of ten years. We have given consideration to the possibility of levying a rate upon lands benefited by new railways. On the face of it such a tax can be justified, but, as pointed out by the Valuer-General (Q. 3958) the difficulties of collection upon an equitable basis have rendered previous attempts in this direction impracticable. We have, therefore, fallen back upon a direct contribution from Consolidated Revenue. The simplest method of arriving at what the sum should be is by taking the actual loss and reducing it by a percentage representing the value of interchanged traffic with other portions of the railway system. We put this at  $33\frac{1}{3}$  per cent., which, on the figures before us, would leave the amount to be borne by Consolidated Revenue in 1923-24 at £394,882. In Victoria, we understand, the percentage paid the Railway Commissioners under a similar system of relief is 60 per cent.

39. The effect these non-paying lines have upon the financial results of railway working in New South Wales is clearly brought out in the following statement. If credit had been allowed the Department for full loss on non-paying lines, there would have been a surplus each year since 1914 inclusive, instead of a deficit in all but 1914, 1923, and 1924. The financial results over the period would have been an accrued surplus of £6,866,410 instead of an accrued deficit of £1,410,106. Even on the Victorian basis, a deficit—quite an insignificant one—would have resulted only in 1917 and 1921, and the net results would then have been an accrued surplus of £3,555,804 instead of an accrued deficit of £1,410,106.

RESULTS

## xxi

RESULTS of working for the years ended 30th June, 1914 to 1924, allowing (a) full credit for losses on non-paying lines, and (b) credit for 60 per cent. of losses on non-paying lines.

Year ended 30th June.	Actual Result.		Result if credit had been allowed Railway Department for full loss on non-paying lines.		Result if credit has been allowed Railway Department for 60 per cent. of loss on non-paying lines.

### Absence of Reserves.

40. The absence of any reserve for the renewal of line and rolling-stock, already referred to, has been provided for in part by charging such renewals as have been carried out to working expenses. Particulars of these we deal with under the heads of rolling-stock and engineering expenditure. That there should be a renewal fund to provide for obsolescence as well as wasting assets and so keep the charges on a level basis, year by year, is undoubted. The accounts, as they stand, do not disclose the actual position, inasmuch as wasted assets are not represented by cash to meet original capital values. This was pointed out to the Railway Commissioners by Mr. Webster Watts in 1921, and that gentleman, in his evidence (Q. 135), stated:—

It is very necessary to equalise the charge for renewals, and it seems to me the only way to do it is to form a reserve fund. What I was, and am still, afraid of is that if there were stringent times, the Government might use the fund so created. If it were definitely under the control of the Commissioners, there would be no such possibility.

He said further (Q. 145):—

In my opinion, the problem of reserve for renewals can only be satisfactorily dealt with if such fund is absolutely under the control of the Commissioners.

Q. 146. That means that the whole of the finance would be under the control of the Commissioners? A. I should think so, or they would arrange their loans, and it might be said that they would save interest, though I do not know that.

Q. 147. If they had an adequate reserve there would be no more difficulty in their raising money than there is in the case of independent railway companies? A. That is so.

Q. 148. We should be glad to hear from you how you think it should be done? A. Provided the reserve should be under the control of the Commissioners, I think the wasting assets should be divided into groups, and an estimate made of the utility lives of the assets comprising such groups. Having obtained this table it would be a matter of calculation to find out the amount which would be properly allocable against profits. This amount would approximate a certain percentage of the total assets, and this percentage would be taken as a basis for the following year.

Q. 149. By the percentage of total assets, you mean the capital cost? A. Yes. It would be necessary to revise this percentage from year to year, as the totals comprising the respective groups would naturally vary. Apart from this there is the question of obsolescence and supersession, and I think in addition to the depreciation reserve, adequate provision should be made for the replacement and renewal of assets which may become obsolete or may be superseded before the expiry of the expected utility lives of such assets. As what should be considered an adequate reserve in this regard will be difficult to determine.

Mr. Coghlan, the Auditor-General (Q. 116A) agreed that, from his experience of the accounts generally, a reserve would be a decided advantage. Mr. Fraser also concurred.

41. In the seven years prior to the war a total surplus, after paying interest charges, of upwards of 3 millions sterling was paid into Consolidated Revenue. Had this amount been placed to reserve for renewal of rolling-stock and line which was deteriorating day by day, a very different state of affairs would have appeared at the present date.

42. Assuming that reserves upon the lines indicated elsewhere had been in operation in 1923 and 1924 the net revenue figures for those years, after giving credit for such renewals as were carried out, and capital items charged to revenue, would have been, respectively, £3,619,675 in 1923 and £3,841,749 in 1924 instead of £1,571,359 in 1923 and £4,699,036 in 1924.

43. To make up for past deficiency in reserve is more than the railway account can bear, and it should be noted that our recommendation under this head, whilst preventing a further slipping back, will not provide for the past which must be made good out of revenue as and when renewal arises.

#### Financial Situation of the Future.

44. In order to form an idea of the probable financial situation in the near future we have obtained estimates of the requirements, in terms of money, of lines and works under construction, as well as those to which the Government is committed, and also the capital expenditure necessary to carry out works such as suburban electrification, which is a corollary to the City Railway, and also rolling-stock and new workshops at Chullora, &c. The total figures given us, including past expenditure on existing lines, are as follow:—

(1) Expenditure on existing lines and works to 30th June, 1924	£93,355,167
(2) Expenditure to 30th June, 1924, on lines not yet completed	5,496,190
(3) Further estimated expenditure on the City Railway	5,800,000
(4) Estimated expenditure on new lines already sanctioned and those not yet approved	6,200,000
(5) Estimated expenditure on additions to existing lines, new rolling-stock, electrification of suburban railways, new workshops at Chullora, &c.	23,000,000
	<u>£133,851,357</u>

45. The present financial position of the railways, as disclosed by the figures, coupled with the evidence upon which we have commented in reference to absence of reserves, and waste upon constructional works, together with the effect of budgeting methods upon the management generally, is not satisfactory. It is less satisfactory from a prospective point of view. The trail of ineffective and hampering finance is in evidence throughout the railway administration. That a drastic change of method is imperative needs no elaboration.

46. New South Wales is not singular in respect of its present methods of financing State railways. We have already said it follows the principles of British Parliamentary budgeting. It is beyond doubt that when the principle of yearly State Budgets was established it was intended to apply to national establishments of army and navy, education, sanitation, and such like. It was certainly not devised to meet the needs of a commercial undertaking. It might with difficulty be made to suffice in the case of a comparatively small concern, but it, by no means, covers the financial requirements of a large railway system. Experience in India and other parts of the British Empire where there are Government-owned railways has proved that, whilst the control by means of a yearly Budget may be necessary and desirable in relation to ordinary departments of State, it does not and cannot permit of a great commercial institution being financed economically, nor enable it to render that service to the community of which it would otherwise be capable. Finance from year to year as part of a consolidated State Budget has been found altogether inadequate to meet the demands of a transport organization which needs, above all things, elasticity in dealing with money problems as and when they arise. The rigid Budget of a State has failed when applied to an organization whose functions include not only the transport of people and things from place to place, but is a building and manufacturing business of large proportions, as well as a buying and selling agency on no mean scale. Everybody in the State, either as a traveller or as a dependent upon essential supplies, is interested in its effective services. Any failure inflicts loss or discomfort upon the whole body politic.

47. Where the people own the railways, there must obviously be public control up to a point, and there will always be Parliamentary criticism of an essential

essential public service, whether State or privately owned, but there appears to be no adequate reason why ordinary business principles should be lacking in either case, more especially under State ownership, where the absence of such principles is, in a measure, responsible for the criticism which arises in the Legislative Assembly. If it is to be held that constitutional necessity blocks the way and cannot be overcome, then it fully justifies the belief of many people in Australia and elsewhere, that a Government cannot successfully manage an industrial undertaking. The form and ceremony of a yearly State Budget have no virtue if they stand in the way of efficient and economical working and management of transport, and the consideration, therefore, of some other form of control becomes necessary.

48. The railway system of New South Wales is a great and valuable asset, whether measured as a revenue-producing machine, or as the principal agency in the rapid development of the country. Despite certain deficiencies, to which we call attention, it reflects credit upon those who have been responsible for its management. It is capable, under good administration, of producing large net revenues and of providing cheap, speedy, and adequate transport throughout the State. On the other hand, in the absence of the immediately necessary and far-seeing system of finance, it may easily become ineffective as a developmental agency, as well as a serious burden upon the State.

#### Control of finances by the Commissioners.

49. We are unable to suggest a satisfactory solution of the disabilities suffered by the Railway Commissioners, apart from taking finance out of Treasury hands and the giving to the Commissioners control of their own funds. This means the elimination of, roughly £110,000,000 (including Tramways) from Consolidated Revenue Account, and the setting up of a separate Finance Department under the Commissioners, who will be responsible for the renewal of loans as they become due and the raising of any future capital required for extensions and equipment of line, rolling-stock or works.

50. Adopting the figures at June, 1924, as supplied to us (para. 44), the Commissioners, under such a scheme, would find themselves with, roughly, £100,000,000 on railway account represented by terminable loans guaranteed by the State, the renewal of which would lie with them. This amount includes expenditure upon lines partly constructed. They would also, under their forecast of future requirements, need, within the next seven years, to seek further capital of not less than £35,000,000. This is a large sum. The major portion of it cannot, and ought not to be postponed, because it follows upon expenditure already incurred in respect of the City Railway, the electrification of suburban lines, construction of Chullora workshops and other smaller commitments. We deal with Tramway expenditure elsewhere. Estimates of the various works making up the total further expenditure are as under :—

#### RAILWAYS.

##### Existing Lines :—

Rolling-stock :			
Engines	...	...	£3,000,000
Carriages	...	...	£2,400,000
Wagons	...	...	£800,000
			£6,200,000
Additions to existing lines, including such works as provision of new workshops, locomotive depôts, increased accommodation at terminals and other stations throughout the system, &c.			
	...	...	£3,800,000
Electrification of Railway lines (existing suburban) and including additions to Power-houses			
	...	...	£10,000,000
Duplication of Main Lines, including completion of works on the Northern and Western Main lines and additional tracks on the Main Suburban, Illawarra, and Milson's Point lines...			
	...	...	£3,000,000
			£23,000,000
			Railway

**Railway Construction :—**

City Railway (now in progress) ... ..	£5,800,000	
New country lines already sanctioned and others not yet approved ... ..	£6,200,000	
		£12,000,000
		£35,000,000

51. Included in this estimate, it will be noted, is £6,200,000 for lines already sanctioned and others not yet approved, and also £3,800,000 for additions to stations, accommodation, &c., a portion of which may possibly be postponed for some time, but even after making some allowance for this we think that the cost of works which may reasonably be expected to be provided during the coming seven years, together with new rolling-stock, can be put down as not less than £35,000,000, or at the average rate of £5,000,000 per annum. In our view this is the limit that should be aimed at. It is possible that, with the electrification of the lines, many proposed items of expenditure will, in consequence of increased facilities, be found to be unnecessary, or, if desirable, not absolutely essential. Turning to the revenue side of the account—taking 1923-24 figures as a basis—the position, after adjustment by debiting reserves for renewals, and crediting a percentage of the loss upon unremunerative lines opened during the past ten years, as well as capital expenditure charged to revenue, shows the 1923-24 net revenue to have been £4,236,631.

52. At the end of seven years interest charges upon the above sum of £35,000,000 at 6 per cent. would be £2,100,000, but it is reasonable to expect that, although the rate at which money can be obtained here is now about 6 per cent., such a high rate will not continue throughout the period, and it should be put at a lower total figure. Even if it does so remain, past records show an increase of net revenue in seven years, from 1918 to 1924, of £2,234,361; but for reduced rates and fares in the latter year to the extent of £481,000, it would have been £2,715,361, whilst reduction of working expenses—unless any disturbing influence supervenes—should, upon the carrying into effect of our report under each head, more than make up for any difference due to the provision of reserves.

53. It would be idle for us, with the very limited knowledge we have of the State's productive and commercial probabilities, to venture upon a forecast of future revenue based upon observations of our own, but past records, even with war troubles intervening, show remarkable progress, and, given a like prosperity in the next decade, the expenditure proposed by the Railway Commissioners should prove remunerative. It may be that the City Railway and electrification of suburban lines will not overtake interest charges for two or three years from the date of opening for traffic, but that the greatly improved facilities, which are so urgently needed, will eventually repay, we have little doubt. The desideratum, above all things, is to complete them so that their full use may synchronise with the opening of the Harbour bridge.

54. There is no sign of a backward tendency in the prosperity of New South Wales. On the contrary, revenue estimates of the Chief Commissioner for the current year are for an increase over last year of £1,000,000 in gross receipts upon the railways as a minimum. New South Wales is straining at the leash for increased and improved transport. It can be relieved by statesmanlike provision to meet present needs and the probabilities of the future.

**Raising of Capital.**

55. It would be unwise to recommend any hard and fast rule by which further capital should be raised by the Railway Commissioners. That must depend upon money market conditions from time to time, but the obvious possibility must be considered of competition between Treasury requirements for the general purposes of the State and appeals by the Railway Commissioners to the money market for funds. It would be desirable that future capital for railways should differ from ordinary State loans and new sources should be explored by the Commissioners independent of the Treasury. It might take one of several forms to be decided upon as the necessity for issue arises. We consider that probably a loan with a sinking fund covering, say, thirty years, either by repayment at the end of

of that time or by drawings every five years, would, at the present time, appeal to a considerable class of investors, especially as the moneys would be applied to expenditure upon reproductive works. In such a case, it might be a railway issue as a first charge on net revenue without Government guarantee. The Government would be guarantors of all loans behind it.

#### Yearly Balance-sheet recommended.

56. In making these recommendations, we couple therewith a continuance of the present liability of the State to meet interest during construction upon new lines. We do not suggest that the promulgation of rates, fares and charges by by-law sanctioned by the Government should be altered. We consider that if at any time the Government arbitrarily fixes rates or charges that are not reasonably justifiable, then upon a certificate of the Auditor-General any loss be recouped the Commissioners by the Treasury.

57. We advocate the submission of quarterly and yearly reports to the Legislative Assembly in accordance with past practice, together with a yearly balance-sheet showing capital, revenue, and net revenue, followed by departmental accounts in the usual company form, and a forecast of the capital commitments for the following year. This should bear the signatures of the Chief Commissioner and the Chief Accountant, and be certified by the Auditor-General.

58. We recommend that the railways be so worked and managed that the gross receipts shall not be more than sufficient to cover working expenses, reserves, and the interest on capital—including sinking funds—that in the event of a surplus it be devoted to reduction of rates and fares. If on the other hand a loss appears, that rates and fares be increased to cover the deficit.

#### Question of Transfer to Private Management.

59. Two representatives of important interests mentioned the question of transferring the railways to private management. We have no evidence that public policy which decreed that railways in New South Wales should be State-owned and managed is likely to change, but if at any time such should be the case a scheme somewhat similar to that shown hereunder could probably be carried out:—

#### SCHEME IN BROAD OUTLINE.

1. The net earnings of the railways to be capitalised at twenty-five years' purchase.
2. The amount thus arrived at to be treated as Government capital in the undertaking.
3. A company to be formed to work the line, this company to raise additional capital on the security of the line without any guarantee from the Government.
4. The net earnings of the line after the formation of the company to be divided between the Government and the company in proportion to the capital of each.

As an illustration it may be assumed that, before the formation of the company, the net earnings are £5,000,000 per annum. The assumed Government capital would be:—

£5,000,000 x 25 ... ..	=	£125,000,000
Capital raised by company, say...	...	£20,000,000
		<hr/>
		£145,000,000

After additional capital invested by the company, the net earnings to be divided in the proportions of:—

$\frac{125}{145}$  to the Government,  
and  
 $\frac{20}{145}$  to the company.

60. With net earnings of £7,250,000, the rate of interest on the assumed Government capital and on the company's capital being always the same, the division of earnings would be as follows :—

Government share.	Company's share.
£6,250,000	£1,000,000
(5% on £125,000,000).	(5% on £20,000,000).

Such a scheme would enable the Government gradually to relieve itself of the responsibility of either providing or guaranteeing capital.

61. It must be understood that we are not recommending this, because, in addition to other reasons, we are of the opinion that, provided our recommendations are carried into effect, the value of the railway property in a few years will be such as amply to repay the State for bearing the burden during the lean years, when the system was being built up.

### III.—ORGANISATION.

62. From their inception the railways of New South Wales have been controlled and managed under what is generally known as the departmental scheme of organisation, centred in Sydney. That it proved efficient while the railways were within easy reach and traffic was comparatively light is evidenced by past records. To-day, however, the line extends from Queensland to the Victorian border, a distance of 900 miles. Upon the completion of the Broken Hill connection, moreover, there will be nearly 700 miles of line between Broken Hill and Sydney, while from the latter place to other terminals in the north, south, and west are distances of 400 to upwards of 500 miles. Altogether the system comprises over 5,500 route miles of railway and serves an area having many variations of climate, with pronounced differences in regard to local conditions, products, possibilities, and transport requirements. A chart showing the present scheme of organisation is given on the following page.

#### Monthly Conferences.

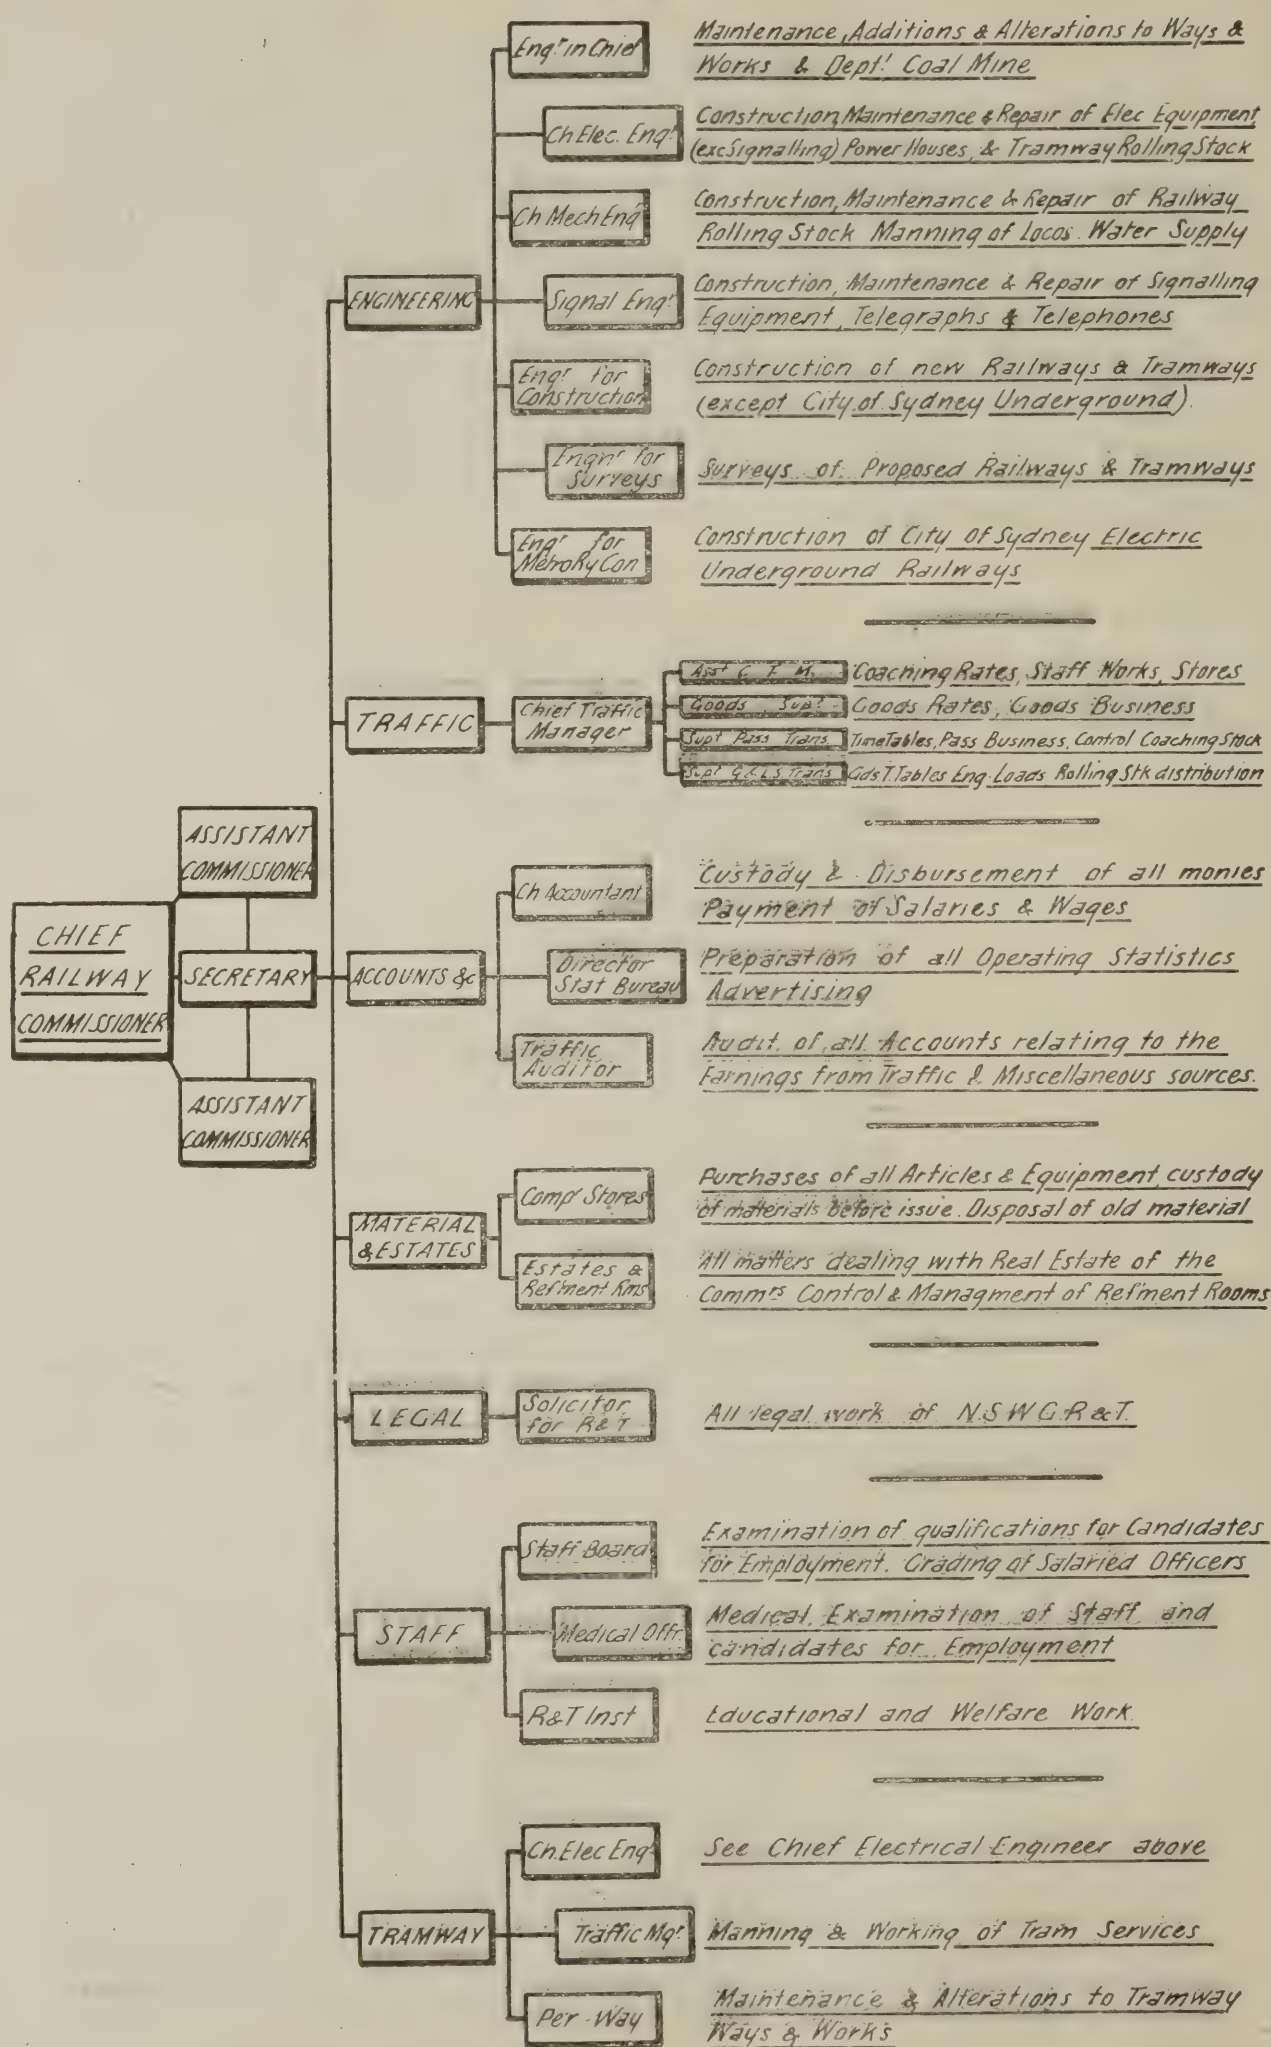

63. The control of departments as at present exercised is mainly by means of monthly conferences, eleven in number, viz. :—

Permanent Way Committee,  
Locomotive and Stores Committee,  
Traffic Committee,  
Tramway Committee,  
Construction Committee,  
Finance Committee,  
Ticket and Fares Committee,  
Medical Committee,  
Staff Committee,  
Institute Committee,  
Ambulance Committee.

In addition there are departmental committees of traffic officers, locomotive officers, permanent way officers, construction officers, and the metropolitan railway construction conference. In order that the various departmental activities may readily be grasped, it is the practice to submit to the monthly committees and to the Board meeting information set out in graphical form. Approximately 400 graphs are prepared monthly for these meetings.

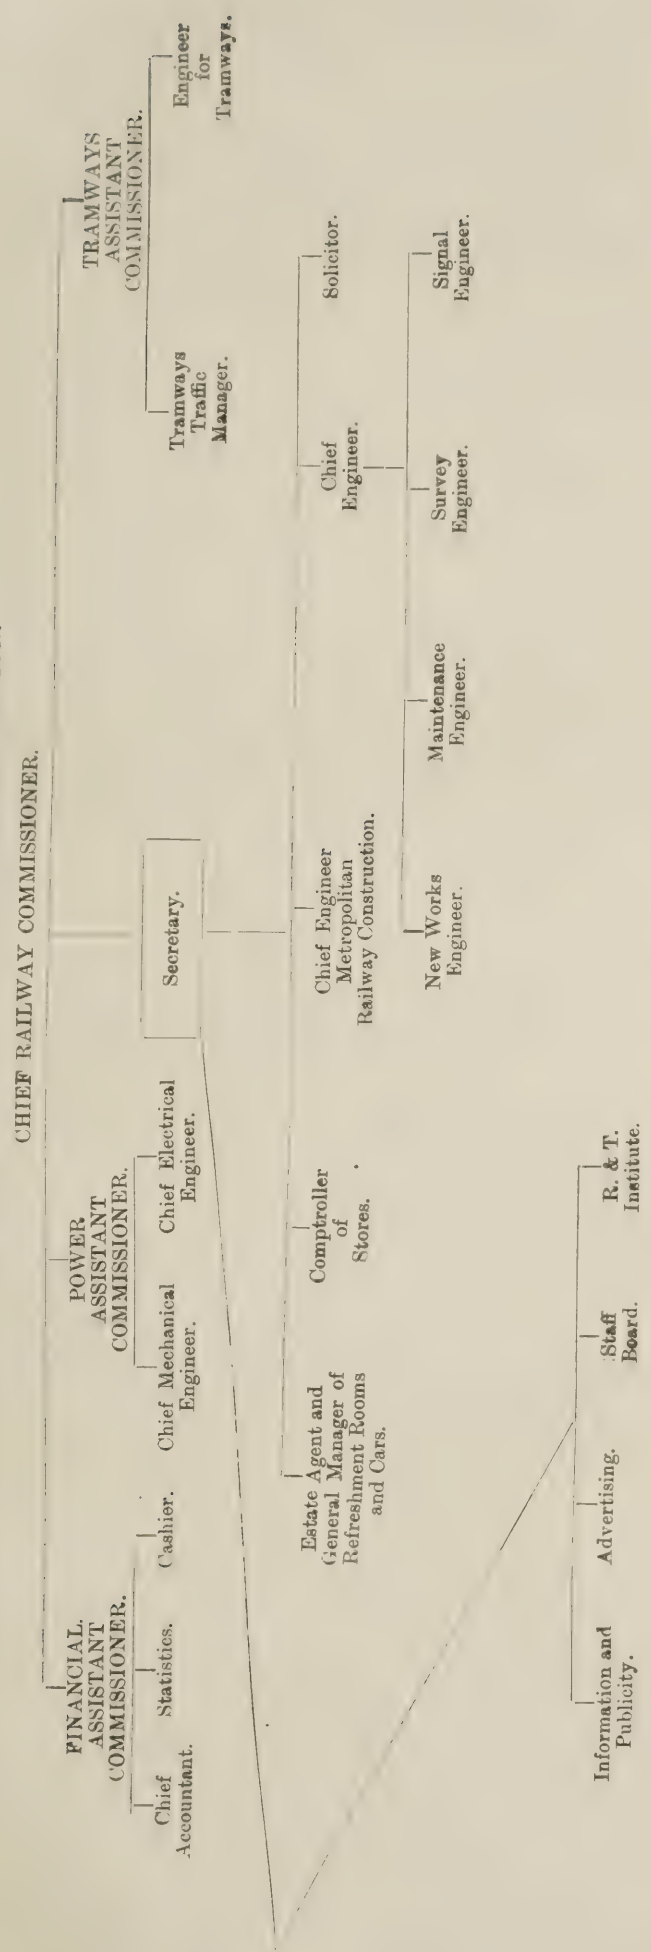

64. The aim and object of these conferences and committees are to ensure that every matter of importance is brought under review monthly and to enable the Chief Commissioner to exercise personal supervision over the work of his departmental officers. In the words of the Chief Commissioner "the spirit of the organisation is that personal supervision is exercised throughout."

65. Where important works are in progress or large expenditures proposed, frequent visits are necessary, and apart from day to day distractions, urban and suburban problems press for solution, inter-State communications demand time and thought, while the growth of mechanical and electrical manufacture in railway workshops has followed increased mileage and increasing traffic density. Thus, however much time and energy a Chief Commissioner may be able to devote to the co-ordination of organisation as a whole, the calls upon him in a variety of other directions are such as to render it impossible for a single mind to keep the personnel in step or meet to the full public demands from distant centres.

PROPOSED HEAD-QUARTERS ADMINISTRATION.

PROPOSED AREA ORGANISATION.

Suggested Scheme of Reorganisation.

### Defects of Centralisation.

66. Centralisation leads distant officers to lean too much upon the central organisation thus divorcing them from the responsibility which is theirs, and for which they are appointed and paid. They are not afforded that opportunity for the display of initiative and diligence so important to a "live man." Centralised management fosters the division of responsibility and control of train movement and of commercial effort, and it results in the frequent calling to head-quarters of distant officials to discuss questions of failure or complaint which could far better be dealt with locally. The loss of many days per annum of valuable time and the absence of these officials from their districts are points of importance in this connection.

67. Examination of Board and Conference Minutes, together with evidence submitted to us, shows that centralisation with its attendant circumlocation no longer enables the Commissioners to manage the various interests committed to their charge as effectively as would be the case under a system of decentralisation. We are, therefore, of opinion—and Messrs. Fraser and Fox concur in our view—that the time has come for New South Wales to follow other countries where extensive systems of railways under a single management are subdivided in respect of operation and maintenance, thus leaving the supreme head of the administration free to devote his attention to matters of broad policy, planning of developments and general control, and allocating responsibility on the transportation side to competent area officers and on the technical side to system officers stationed at head-quarters.

68. That the defects of centralisation have not escaped the notice of members of the public who are acquainted with railways abroad is shown by evidence tendered on behalf of the Producers' Association Central Council, the Mayor of Newcastle, and the Sydney and Newcastle Chambers of Commerce.

### Composition of Railway Commission.

69. Dealing first with the composition of the Commission we consider that, having regard to all the circumstances surrounding transportation in New South Wales, there should be:—

1. A Chief Railway Commissioner,
2. A Financial Assistant Commissioner,
3. A Power Assistant Commissioner,
4. A Tramway Assistant Commissioner,

and that there should also be appointed three Area Commissioners, responsible to the Chief Commissioner, and acting under regulations and instructions applicable to the system as a whole, for operation, commercial matters and maintenance within their respective areas, the keynote being centralisation of principles with decentralisation of details, thus making for greater economy, more effective working, and improved relations with freighters and the public.

### Area Management.

70. We suggest that one Area Assistant Commissioner with offices at Sydney should take charge of the metropolitan and southern area, as shown on the map. This area comprises approximately 1,616 miles and has a traffic density of 96,575 tons per mile per day on passenger, goods, and departmental trains. The time-tables and the distribution of rolling-stock throughout the system should be co-ordinated through the Assistant Commissioner of the metropolitan and southern area.

71. A second Area Assistant Commissioner, with offices at Newcastle, to take the area from Hornsby northward as shown on the diagram. This area comprises approximately 1,741 miles, and has a traffic density of 73,195.

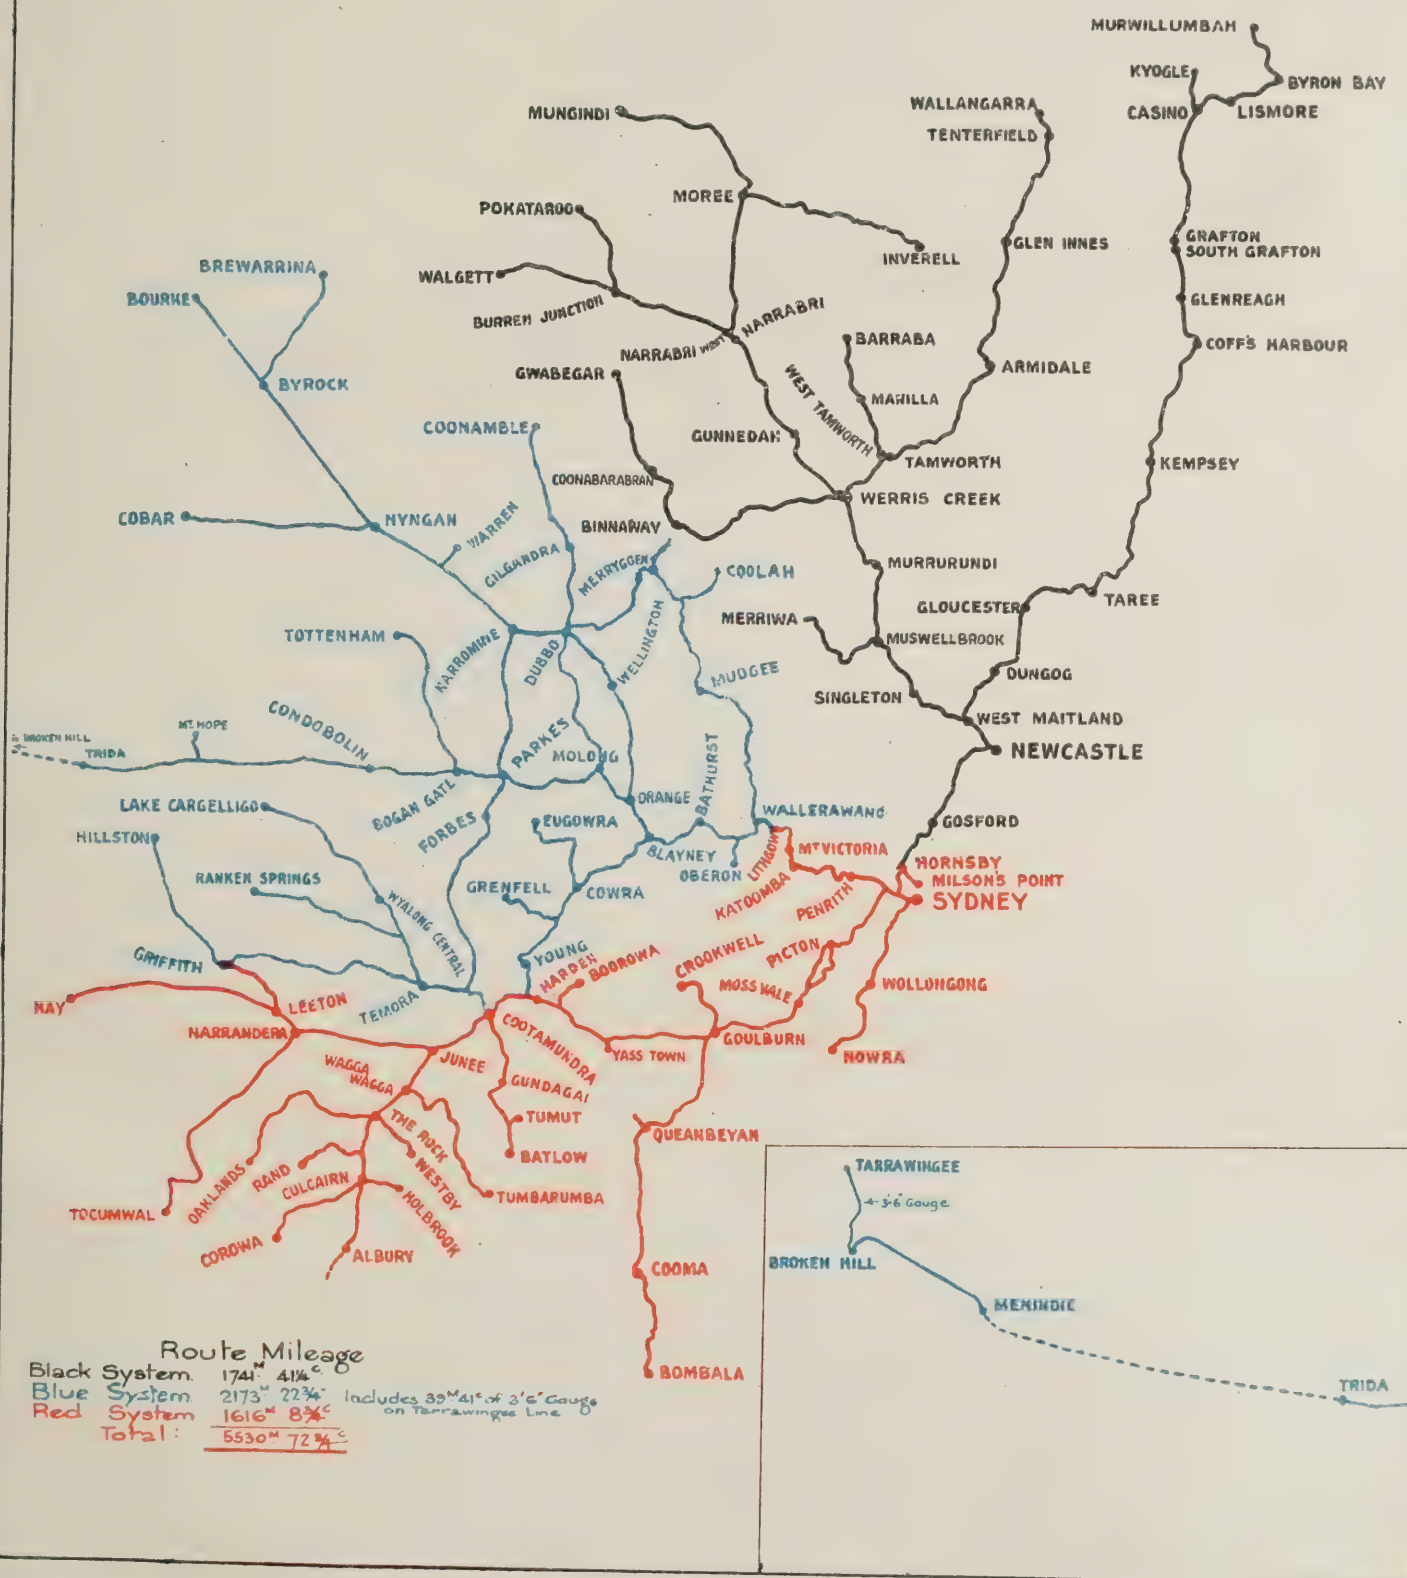

72. A third Area Assistant Commissioner with offices at Bathurst to take the lines from Lithgow westward as shown in the diagram. This area covers approximately 2,173 miles and has a traffic density of 29,090.

Scale of Miles

Area Scheme of Management recommended.

Black—Northern Lines. Blue—Western Lines. Red—Metropolitan and Southern Lines.

THE LIBRARY  
OF THE  
UNIVERSITY OF ILLINOIS

### The Chief Commissioner and the Financial, Power and Tramway Assistants.

73. The Chief Commissioner to have responsibility to the Government for carrying into effect the provisions of the Railways Acts, and his decision upon all matters coming within those Acts should be final in all respects.

74. The Financial Assistant Commissioner, being specially qualified in financial and accountancy matters, to have general supervision of the banking, accountancy, audit, and statistical offices. We advocate an enlargement of the Chief Accountant's responsibilities. The Chief Accountant should be Chief Accountant in fact and not merely in name, and should have included in his department all the Branch Accountants, the present working arrangements between the head of each branch and the appropriate section of the Accountant's Department being maintained.

75. The Power Assistant Commissioner should control all establishments connected with the production of power, whether steam, electric, or otherwise, workshops, line installations, and the coal-mine. The changed and changing character of modern power appliances, coupled with the recommendations we make elsewhere, invest this appointment with special significance, and we attach great importance to it in view of the bearing that an experienced and wise decision will have on the traction problems in sight.

76. The Tramway Assistant Commissioner to control the tramways, electric and steam.

### Chief Officers at Head-quarters.

77. The Chief Officers at head-quarters would be as follow :—

- (1) A Secretary, under whom should be the Information and Publicity Officers, together with Advertising and Institute matters ;
- (2) A Solicitor to deal with the whole of the legal work of the Department ;
- (3) A Chief Engineer who, with the necessary assistance, would supervise the survey and construction of new lines and works (the City Railway excepted), and the maintenance and renewal of existing lines, including signalling ;
- (4) A Chief Engineer for Metropolitan Railway Construction, his duties remaining as at present ;
- (5) A Chief Mechanical Engineer, responsible for the design, maintenance, and renewal of rolling-stock, the management of locomotive workshops and plant, and the supervision of running sheds ;
- (6) A Chief Electrical Engineer in charge of power-houses, electrical workshops, the design and equipment of electrical appliances and plant ;
- (7) A Chief Accountant, responsible, with proper assistants, for all accountancy and audit work ;
- (8) A Cashier to deal with all cash receipts and payment of wages ;
- (9) A Comptroller of Stores, responsible for the purchase—under the instructions of the Commissioners—of all stores, and the custody and distribution thereof ;
- (10) An Estate Agent and Manager of Railway Refreshment Rooms and Cars.

78. The staff of each Area Commissioner would comprise an Engineer Assistant, selected by the Chief Engineer, a Mechanical Assistant, selected by the Chief Mechanical Engineer, and a Traffic Superintendent (Operating and Commercial). The Engineer and Mechanical Assistants to report monthly through their Area Commissioner to the Chief Engineer and Chief Mechanical Engineer respectively upon work performed, the state of works and machinery under their charge, and take instructions thereon. In addition to this the responsibility of the Chief Engineers, civil and mechanical, to be exercised by frequent inspection by themselves or their principal assistants.

79. The Area Assistant Commissioners, given a wide discretion with encouragement to develop the areas under their charge, and being clothed with the necessary authority to deal with problems as they arise or seek advice when in doubt, would relieve head-quarters from a mass of detail and correspondence.

Being

Being in direct contact with freighters and the people in general, they would be enabled to familiarize themselves with the conditions, ideas, and needs of each town and district, and obviate formal communications and orders from the Chief Commissioner. They should make management personal, as distinguished from distant management, which tends to appear impersonal. Many of the local grievances to which our attention has been directed could promptly be dealt with, or would probably never arise, under the more direct and authoritative supervision of the Area Assistant Commissioners. We suggest that formal conferences at head-quarters should not be held more often than once in three months. Monthly conferences, apart from taking officers from their daily duties, consume much time and thought in the preparation of details, and often develop into a series of inquests, with resultant irritation to the staff, who had far better be employed in studying future requirements rather than in bemoaning the past.

80. The District Superintendents would continue as at present, with such geographical adjustment as may be necessary within their districts. We refer elsewhere to their particular duties. Whilst the Area Commissioners require a competent head-quarters' staff, it is considered that there need be little, if any, increase in the total personnel, having regard to the release from the present central organization of a number of able officers available to fill positions in the areas. It is notable that when a somewhat similar form of decentralisation was introduced upon the South African Railways a reduction was effected in the number of officers.

#### **Selection and Appointment of Commissioners.**

81. With regard to the selection and appointment of Commissioners, the desideratum is to secure harmony and team work in its fullest sense at head-quarters. If that is attained its influence for good will be felt from the top to the bottom of the Railway Service. Its absence means the reverse. Viewing the making of the appointment, not as a function of Government in the ordinary sense, but as the selection of a general manager to run a business undertaking, we are convinced that the appointment of a Chief Commissioner by the Government should begin and end at that appointment. It should be left to the Chief Commissioner to select his own assistants.

82. We do not overlook the fact that this places all appointments in the hands of one man, but his is the responsibility and upon him would fall the result of failure. Moreover, his share of the work and his personal comfort are so involved in the choice of competent and tactful assistants that he is not likely to be influenced by any motive other than that of securing the very best man for each position. This suggestion follows practice in Canada and elsewhere, and none can say that the outcome has been anything but satisfactory. If politics enter into appointments of this character, apart from other obviously objectionable features, it leaves a loophole for blame being distributed over several heads in the case of failure, and thus becomes detrimental to the entire undertaking.

83. As a general proposition we may say—Governments come and Governments go, policies change and are reversed according to the political hue of the Ministry of the day, but the transport needs of a State are constant, they are vital factors in the everyday life of all the people and should not be made in any way the shuttlecock of politics. They should be free from influence of either party, and when once a Chief Commissioner is appointed he should be trusted to carry on his duties to the best of his ability in his own way, subject solely to the limitation of his powers in regard to rates and fares, staff, and other matters of defined State policy.

84. We do not think that the practice of making appointments for a definite term of years is calculated in the long run to produce the best results. A Chief Commissioner should have a vision and an aim beyond seven years. There is a risk of a good showing being made at the end of such a period without due regard for the future of the business. As an alternative to the present system, we suggest that the appointments should be without limitation as to time, and that the Commissioners should be deprived of office only on proof of misbehaviour or incompetence. In the latter event compensation should be given on the basis of five years' full salary. As justification for giving such compensation, we regard the

the Government as responsible for an incompetent Chief Commissioner, and the latter as responsible for incompetence in his assistants. It is not the fault of the man; it is his misfortune if he proves incompetent for the post he has been selected to fill. It may be said that he should pay the penalty of failure to fill the position satisfactorily, but such a man is not circumstanced as an artisan or labourer. He cannot walk into the next street and get a job. Failure to a Commissioner of Railways means ruin. There are no similar positions open to him, and the railway undertaking should pay for the mistake made in his appointment.

#### Salaries of Commissioners.

85. It may not be within our province, but we venture to offer some remarks upon the question of salaries. Hitherto the rates fixed by Parliament as remuneration to the Commissioners have been altogether out of proportion to that given in other countries for positions of similar responsibility. Apart from the Commissioners' salaries as such being upon a low scale they have an effect upon the pay of the principal technical officers who cannot obtain even as much as an Assistant Commissioner, although the pay of the latter is below the figures easily secured in industries outside the railway by engineers of known capability and experience. In recent years there has been a general recognition of the fact that the difference in value between a first-class man and a mediocrity as head of a large industrial undertaking or section thereof is not to be measured by a few thousand pounds per annum. Furthermore, in the past few years there has been a general rise throughout the world in salaries as well as in wages. This is a question of securing and keeping the best men it is possible to obtain in Australia, and, reviewing it in the light of official salaries in this part of the world, we think that, as a minimum, they should be, as to the:—

Chief Railway Commissioner...	...	...	£5,000 per annum.
The Financial Assistant	...	...	£4,000 " "
The Power Assistant	...	...	£4,000 " "
The Tramway Assistant	...	...	£3,000 " "
Each of the Area Assistant Commissioners	...	...	£2,500 " "

86. The carrying into effect of the various recommendations we make in this section of our report will, we have every reason to believe, achieve the best results with the least expenditure of time and money.

## IV.—MANAGEMENT.

## (a) PERMANENT WAY AND WORKS.

**Mileage.**

87. The route mileage of line for the maintenance of which the Chief Engineer for Existing Lines is responsible, totalled, at June of this year, 5,523, with a track mileage of 6,261, consisting of 4,876 single, 1,197 double, 28 triple, 155 quadruple, and 5 quintuple tracks. The total track mileage, average single track, including sidings, maintained for the year 30th June, 1924, was 7,316 miles.

**Grades and Curves.**

88. The striking features of the line are sharp curves and steep gradients. The main route from Sydney southwards has many short sections of 1 in 40 to 1 in 66, and there are considerable lengths of 1 in 75. The Western main line to Bathurst is even worse, with portions as stiff as 1 in 31, and, in the reverse direction, 1 in 40. On the Northern route 1 in 40 is common. It may be said that until the plains are reached there is no section without abnormal gradients and curves. The configuration of the country is such that without enormous expenditure these disadvantages cannot entirely be overcome. Here and there some alleviation may ensue by re-alignment, but not sufficient to permit of any material reduction in the cost of working and maintenance.

**Rails, Sleepers and Ballast.**

89. The standard rail is of the "T" type, and varies in weight from 100 to 60 lb. per yard. Rails of 100-lb. section are laid within the metropolitan area, while 90-lb. section rails are the standard on the main trunk lines to Cootamundra, Wollongong, Orange, and Werris Creek, the remaining mileage on the trunk lines being renewed with 80-lb. section rails. The latter section is adopted as standard for the principal branch lines, but there is still a lot of 71½-lb. rails, while pioneer lines are laid with 60-lb. section rails. When re-laying is necessary, pioneer lines are re-laid with 80-lb. section recovered rails.

90. The standard road provides for ironbark or other selected hardwood sleepers, 8 ft. x 9 in. x 4½ in., laid eighteen to a 40-ft. rail length. The general world standard is 9 ft. x 10 in. x 5 in., but experience over many years has shown that the Australian heavy wood sleepers of a smaller size are satisfactory. The rail joints are staggered, with sleepers spaced 2 ft. 3½ in. and 1 ft. 8 in. at joints. Ballast is, as to the bottom, hard sandstone, 3 in. gauge, and at the top 2½ in. blue-metal. Pioneer lines are ballasted with earth, strengthened where necessary with gravel, sand or ashes. Quarries for the provision of ballast have been opened up in each division, the ballast being dealt with in hopper wagons and plough-spread. The permissible axle-load is 20 tons 7 cwt. on main lines and from 17 tons 7 cwt. to 13 tons 4 cwt. on branch and pioneer lines, according to the weight of rail in use. The track is noisy. We suggest that experiments be made to overcome this.

**Construction and Maintenance Costs.**

91. As representative of constructional and maintenance cost per mile, we have been given the following examples:—

## PERMANENT WAY CONSTRUCTION AND MAINTENANCE COSTS.

					<i>Double Track.</i>			
Section.							Constructional cost per mile. £	Maintenance cost per mile. £
Southern Line—								
Granville to Goulburn					...	...	42,528	794

92. Constructional costs follow the heavy character of works over the mountains, and to a certain extent maintenance is under a similar influence, plus traffic density. Re-laying, re-railing, and re-sleepering are the subjects of yearly estimates by district engineers, and are checked by the Chief Engineer for Existing Lines.

### Re-laying, Re-railing and Re-sleepering.

93. For the year 1922-23 25½ miles were re-laid, while 47½ miles were re-railed and 192 miles re-sleepered. In 1923-24 the programme covered 44½ miles re-laid, 86 miles re-railed, and 190 miles re-sleepered, but this was not fully carried out. A statement showing the cost per mile of re-sleepering, re-railing, and re-laying complete for the years 1922-23 and 1923-24 is appended.

STATEMENT showing cost per mile of Re-sleepering and Re-railing, and total cost and length of work done of Re-laying complete of 100-lb., 90-lb., 80-lb., and 75-lb. track for the years ended 30th June, 1923 and 1924.

Year ended 30th June.	Cost per mile.		Relaying complete—Total cost and work done.														
	Re- sleeper- ing.	Re- rail- ing.	100 lb. rails.			90 lb. rails.			80 lb. rails.			75 lb. rails.			Total.		
			Total	Work	Cost	Total	Work	Cost	Total	Work	Cost	Total	Work	Cost	Total	Work	Cost
			cost.	done.	per	cost.	done.	per	cost.	done.	per	cost.	done.	per	cost.	done.	per
			£	m. ch.	£	£	m. ch.	£	£	m. ch.	£	£	m. ch.	£	£	m. ch.	£
1923 ...	1,152	2,369	6,514	1 66½	3,563	10,479	3 11½	3,330	56,863	18 6½	3,145	5,879	2 33	2,437	79,735	25 37½	3,132
1924 ...	1,039	2,321	19,992	5 46½	3,584	39,728	11 66½	3,357	49,204	15 13½	3,243	18,368	7 43½	2,438	127,292	40 9½	3,172

94. Since 1888, 1,094 miles of track have been completely re-laid, 3,261 re-sleepered, and 1,244 re-railed.

95. The average life of rails is given as :— “ 100-lb. section, eighteen years; 90-lb. section, no experience of life, as such rails were first laid in 1915; 80-lb. section, twenty years; 71½-lb. section, forty years, and 60-lb. section, twenty-five years.”

96. No cash reserves exist to meet re-laying, the work done year by year as a result of inspection being relied upon to keep the lines up to standard. This means irregular expenditure in one year as against another. Calculated upon the life of rails, there should be an average of at least 200 miles re-laid each year. Future costs cannot be determined. Based, however, on present price of materials and labour costs, a figure may be given of £3,000 per mile, a total of 200 miles of £600,000 per annum. In the event of a less mileage being re-laid in any one year, we consider that a reserve, representing wastage, should be set up to provide for the future and to keep accounts under this head level year by year.

#### Permanent Way Workshops.

97. There are five workshops for meeting permanent way and other requirements. At White Bay, Sydney, the preparation of structural steelwork for power-houses and workshops is carried out, as well as a variety of other things such as steelwork for upcast and downcast shafts and screening plant for the coal-mine. Repairs to pumps and winches, concrete mixers, steam shovels, and a number of articles for tramways and concrete articles of sorts are also manufactured at White Bay.

98. At Lidcombe the manufacture of fish-plates, crossing gates, barrows, and permanent way tools is carried on. The preparation and in many cases the assembly of all wood materials in connection with erection and repairs of buildings and bridges, including refreshment-room fittings, is also done. These shops form a despatching centre for nearly all oregon and redwood required for railway and tramway construction and repair, approximately 3,000,000 super. feet being handled, milled and dispatched to the various districts each year.

99. At Newcastle the fabrication of steelwork for bridges, gantry and jib cranes, switches and crossings, trolley wheels, dog spikes, fishbolts, nuts, rivets, insulator pins, railbending for City railway, &c., &c., is carried out together with castings—brass and iron—the latter up to 5 tons in weight. General repair work for the Newcastle Division also comes here.

100. At Goulburn the workshops provide for the manufacture of cart weighbridges, wirewoven work, corrugated-iron tanks, cisterns, galvanised baths, stove-pipes, tools, small iron, brass, gunmetal, and aluminium castings, and general repair work for the Goulburn Division. A concrete plant turns out water-troughs, foundation blocks, posts, and other articles. The use of ferro-concrete on the railways of New South Wales is a distinct feature (and has undoubtedly done much to reduce the cost of many articles hitherto having a short life owing to climatic and other conditions).

101. At Bathurst, in addition to repairs and the preparation of points and crossings, fencing material, &c., &c., plumbing work for railway and tramway needs, such as tanks, guttering, down pipes, stove-pipes, fire buckets and so on is dealt with.

102. Speaking generally, these shops are well equipped and managed, the class of work turned out being good.

103. In addition to maintenance and duplication of lines, the erection and maintenance of power-houses, station buildings and workshops, the supervision of the departmental coal-mine comes within the duties of the Chief Engineer for Existing Lines, but he is not concerned with survey work or the construction of new lines, for which the Engineer for Surveys and the Engineer for Railway and Tramway Construction are respectively responsible. The upkeep of stations and buildings is satisfactory.

#### Organisation of Branch.

104. The technical staff of the Chief Engineer for Existing Lines includes a Chief Assistant Engineer, Supervising Engineer, Inspecting Engineer, Principal Designing Engineer, two head office Surveyors, Inspector of Bridges, Inspector of Timber, and a Superintending Engineer of the coal-mine.

105. For engineering purposes the system is divided into four divisions, each controlled by a divisional engineer, stationed at Sydney, Goulburn, Bathurst, and

and Newcastle respectively. The sections of the North Coast line, Grafton to Murwillumbah, and Casino to Kyogle, a distance of 167 miles, are under the control of a Chief Inspector. The section from Broken Hill to Menindie (73 miles) being isolated from the general system, is controlled by the Tramways Manager in conjunction with the Broken Hill-Tarrawingee Tramways.

106. The Metropolitan Division, with Sydney as head-quarters, extends to North Goulburn on the Southern Line, Raglan and Werris Creek on the Western Line, and the Illawarra Line (South Coast) to Nowra, including branch lines, a distance of 1,379 miles. The Southern Division extends from North Goulburn to Albury, (Victorian border) and all branch lines, a distance of 1,731 miles. The Western Division extends from Raglan to Bourke and all branch lines, a distance of 1,382 miles. The Northern Division extends from Gosford to Wallangarra (Queensland border) including branch lines to Mungindi, Walgett, Pokataroo, and Inverell on the north-west, and South Grafton on the North Coast, a distance of 1,490 miles.

107. Each Divisional Engineer has an inspector for permanent way, an inspector of buildings and bridges, and sub-inspectors for each district into which his section is divided. There are also timber inspectors and the necessary surveyors and draughtsmen attached to each division. Resident engineers are employed for new works of magnitude, as occasion arises.

108. The average number of men in a line gang varies. In the metropolitan suburban area six men are employed; on the main lines four, and on branch lines three. Where necessary motor trolleys are provided to enable the maintenance staff to move easily and quickly over their lengths. The average length of line maintained by each gang is main line, single track, 8 miles, and branch lines, second class, single track,  $10\frac{1}{2}$  miles.

#### Monthly Conference.

109. A conference, of which the Engineer for Existing Lines is chairman, is held at the head office each month, with the principal officers responsible for the maintenance of way and constructional works, including Assistant Engineer-in-Chief, Supervising Engineer, Principal Designing Engineer, Divisional Engineers, and Resident Engineers, when matters appertaining to maintenance and constructional works are reviewed, and consideration is given to suggestions for improvements in the methods of carrying out the works in the most economical manner, number of staff employed, and the necessity for increasing or decreasing requirements as the work demands.

110. Generally the upkeep of the line is sufficient for the present traffic requirements, but with electrification a higher standard of maintenance will probably be found necessary in the Sydney area.

#### Railway Construction Branch.

111. The engineering staff for the construction of new lines was formerly under the Minister for Public Works, the lines being handed over to the Railway Commissioners for working upon completion. In 1917 constructional work was handed over to the Commissioners. New lines come into being as the result of local application to the Public Works Department, which takes evidence through a standing committee. Trial surveys are made, estimates prepared, and reports forwarded to the Minister by the Commissioners. The standing committee having reported in favour of new lines, and Parliamentary sanction being given, the Commissioners may be instructed to proceed with the work, when a permanent survey and plans and sections are prepared—and upon the necessary money being provided for a year's work construction is commenced.

#### High Cost of Surveys.

112. Surveys appear to be exceptionally high in cost, the estimate for the Glenreagh to Dorrigo line, for example, being given as £22,158. It was explained, however, that the country through which the line passes presented abnormal difficulties. In this connection we are of opinion that benefit would accrue from the supervision of this work by the Chief Engineer for Existing Lines, as recommended in Part III of our report.

Speedy

### **Speedy Construction Essential after Line is Sanctioned.**

113. Estimates of total cost of constructing lines are of little value, having regard to the practices described in Part II of our report, but there can be no doubt that the final costs have been inflated quite unduly by the long-drawn-out methods of construction. These uneconomic methods should certainly be avoided in future. Once a line has been sanctioned the money should be made available for its speedy completion, thus enabling the capital spent to be interest-bearing and not unproductive.

114. Constructional plant to the value of £150,000 is in use upon these lines, and additional tools, stores, and material required are requisitioned from the Comptroller of Stores. Locomotives are supplied by the Chief Mechanical Engineer. Rails and fish-plates are supplied under contract. Dog spikes and bolts are made in the workshops of the Chief Engineer for Existing Lines, or at Eveleigh Shops. Sleepers are bought directly from the cutters, preferably in the neighbourhood of the new lines.

### **Construction Branch Technical Staff.**

115. The technical staff under the Chief Engineer for Railway and Tramway Construction consists of a Principal Designing Engineer, two Inspecting Engineers, two Inspectors of Machinery and Plant, and twenty draughtsmen. In addition, Resident Engineers in charge of each line under construction are employed, of whom there are at present ten.

116. The Engineer for Surveys has a staff of sixteen Surveyors, of whom two are Inspecting Surveyors, and twenty-one draughtsmen.

117. It is probable that but for the fact that the Construction and Survey Engineers were transferred as separate departments from the Public Works Department to the Commissioners, all their work would have been under the supervision of the Chief Engineer for Existing Lines. It is certainly desirable that the engineer who takes over responsibility for maintenance of the new lines should also be the authority for survey and construction, and in our report upon organisation we recommend this. Moreover, the employment of three engineers independent the one of the other makes head-quarters engineering staff top-heavy.

118. The City and Suburban Railway Construction is a very special work, and is properly under a separate and expert engineer. His technical staff includes a Principal Designing Engineer, a Designing Engineer, a Supervisor of Construction, a Supervising Engineer, and the necessary complement of draughtsmen.

### **Early Completion of Metropolitan Electric Railways urged.**

119. The total expenditure on the City Railway and the Eastern and Western Suburbs Railways was, at 30th June, 1924, £1,091,112. An increasing sum of money will be lying idle on these works until they are available for traffic, and the desirability of bringing them to completion at the earliest possible date needs no other demonstration. The saturation of tramway services is calling for relief as well as the suburban steam-train services. Even under the speediest possible construction, congestion of existing facilities promises to be far more serious than at present before the city lines and the electrification can be completed.

## **IV.—MANAGEMENT.**

### **(b) SIGNALLING.**

120. In accordance with the Commissioners' policy this Branch has been considerably enlarged during recent years, more particularly in the direction of automatic and power devices. Increased expenditure consequently arises, but the railway has been vastly improved from the point of view of safety and facility of operation, a total of 300 miles being under automatic control. Automatic signalling is at present being installed at various places, while improved methods have recently been introduced at Sydney.

**Responsibility**

### Responsibility of Signal Engineer.

121. The Signal Engineer is responsible for the installation and maintenance of all signalling and interlocking apparatus on the railways and tramways. Line wires and poles for telegraph, telephone and safe working instruments are also in his charge, the line wires in the Sydney and Newcastle areas excepted, these being under the Electrical Engineer. Telephones throughout the system are also maintained, with the exception that certain telephones in Sydney and Newcastle are maintained by the Electrical Engineer, as are also telegraph instruments and batteries throughout the line. We think it would be an advantage to place all these under one control. Power for signalling purposes is supplied by the Electrical Branch up to the transformers used for signalling, the Signalling Branch taking over from the secondary side of such transformers.

### Signal Branch Workshops.

122. Workshops—to be transferred to Chullora—exist at Sydney and Auburn, for the manufacture of apparatus required for signalling and interlocking purposes. Certain articles appertaining to signals are made in the electrical engineering workshops or at the Newcastle engineering shops. Wire is purchased under contract, as are also signal point mechanisms, relays and transformers. In the signal shops are made station indicators, office furniture, luggage barrows, lamps, footwarmers and other things. At Auburn a ferro-concrete plant supplies material not only for signalling but for station buildings. The decision of the Commissioners to concentrate manufacture at Chullora is evidently wise, and in the interests of economy, not only in this particular case, but in others where the making of similar articles is going on at a number of places under separate branch control.

### Signal Branch Technical Staff.

123. The signal engineering technical staff comprises two Assistant Outdoor Engineers, one for electrical and the other for mechanical work, one Assistant Engineer, a Chief Draughtsman and eighteen draughtsmen. There are also two electrical supervisors, two inspectors and two sub-inspectors for Sydney, one inspector and two sub-inspectors for the Metropolitan Area, an inspector at Goulburn, an inspector and sub-inspector at Cootamundra, similar staff at Bathurst and Newcastle, an inspector at Tamworth, and a relief inspector. For construction work in Sydney there are two inspectors and one sub-inspector, and on the Molong-Dubbo Railway one inspector and one sub-inspector. The total number of employees in the Department is 1,357.

124. For the workshops there is a Works Manager, Assistant Works Manager, and twelve sub-foremen, supervising 451 men. There are also an Assistant Engineer for steelwork and ferro-concrete, two sub-foremen and draughtsmen.

### Safe Working Equipment.

125. The safe working equipment in use on the lines now includes 433 signal-boxes, 23,679 lever units, 475 blocks instruments, 496 electric staff and tablet instruments, 16,372 miles of line wire, 1,132 power worked points and signals, and 423 automatic signal arms.

### Advantages of Automatic Signalling.

126. The policy of installing automatic signalling on certain country lines, in some cases where the traffic is comparatively light, would at first sight appear somewhat extravagant, but actually it is a direct economy. Although the initial cost and maintenance of automatic signals are slightly higher than that of manual signalling, it must be borne in mind that the eight-hour day and the relatively high rate of wages in New South Wales have an important bearing on the subject. With manual signalling three shifts of men are required at every station and crossing loop, whereas automatic signalling necessitates personnel only at the more important stations. As an illustration, the Molong to Dubbo line may be cited. This line, 80 miles in length, under manual signalling would require the staffing of sixteen stations and crossing loops, but with the automatic installation only five stations need be manned. Further, with light traffic and under special circumstances, the whole 80 miles could be controlled by one man stationed at a convenient point.

### Signalling Developing on Sound Lines.

127. It is an admitted fact that the replacement of the human element by safe mechanical operation increases the safety of working which, apart from the question of cost, should be the first consideration in determining the method to be used. We consider the Commissioners are justified in continuing along the lines they have adopted, and that the system of signalling generally is proceeding on sound lines, varying in accordance with the importance and density of the traffic. We suggest, however, that before determining upon the power to be employed for signalling the City Railways, consideration should be given to the advantage of using one power only, viz., electric. To extend the system at the Sydney terminal with an auxiliary power in the shape of pneumatic is unnecessary, and cannot be used or maintained without expense. On an electrically operated line ample power is available, and should suffice for all signalling requirements.

### Signal Branch should form part of Chief Engineer's organisation.

128. In connection with the organisation of the Signal Engineer's Branch we think economy and improvement would result from a combination of the electrical and mechanical assistants under one head. Further we consider that, as this branch is so mixed up with the engineering generally, not only in the workshops but upon the line, it should form part of the Chief Engineer's organisation as indicated in Part III of this report.

## IV. MANAGEMENT.

### (c) MECHANICAL:

129. As the biggest spending department of a railway undertaking, the branch administered by the Chief Mechanical Engineer requires special attention in an inquiry of this nature. A correct appreciation of the relative efficiency of the Department calls for close observation and inspection of the workshops, running sheds, locomotives, and rolling-stock generally, and a critical examination of cost figures in the light of existing conditions, and in comparison with other railways. The views and recommendations advanced in this section are, therefore, of special importance, as they directly affect expenditure and have a vital bearing upon economical and efficient railway operation.

130. This Branch is under the control of the Chief Mechanical Engineer, who is responsible to the Railway Commissioners for the proper maintenance and upkeep of rolling-stock, pumping stations, cranes and machinery in outside places such as docks, &c., running sheds, and the control of engines at those places, together with the running staff connected therewith. He is also responsible for the supply of all water for railway purposes, except where supplies are available from shires or town councils, and for the operation and maintenance of the hydraulic power station at Newcastle and the mechanical portion of the loading cranes. In addition, he is responsible for the electrical equipment of the electric trains to operate the Sydney Suburban Services and Underground Railways.

131. The gas required for carriage lighting is manufactured in gasworks controlled by the Chief Mechanical Engineer, these being established at McDonaldtown (adjacent to Eveleigh), Junee (on the main Southern Line), Bathurst (on the main Western Line), Newcastle and Werris Creek (on the main Northern Line), but, as it has been arranged to convert all gas-lighted carriages to electric lighting within five years as from January, 1924, these gasworks will be dismantled within that period.

### Organisation.

132. The accompanying chart shows the organisation of the Chief Mechanical Engineer's Branch. This indicates that the Department has two broad divisions, both functioning under the head of the Branch through an Assistant Chief Mechanical Engineer. One branch is primarily concerned with locomotive matters, and the other, under a Principal Assistant Engineer, with carriages, wagons, research, &c. The Head Office staff numbers 277, 112 being officers, 132 clerks, and 33 wages staff.

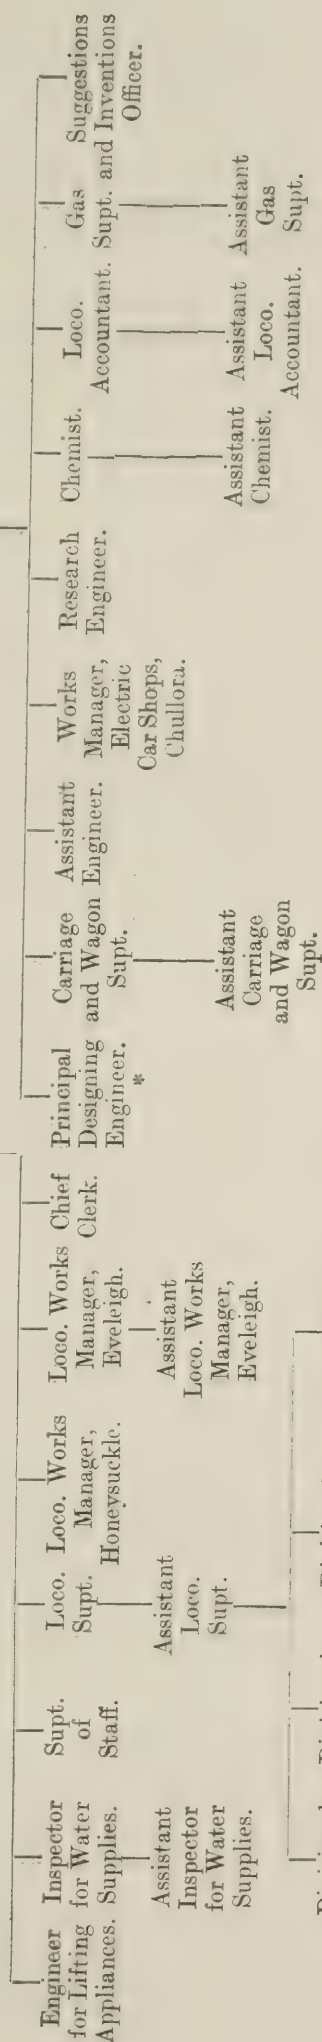

CHIEF

CHIEF MECHANICAL ENGINEER.

ASSISTANT CHIEF MECHANICAL ENGINEER.

PRINCIPAL ASSISTANT ENGINEER.

\* This Officer deals directly with either the Chief Mechanical Engineer or the Assistant Chief Mechanical Engineer on Locomotive matters.

Organisation of the Chief Mechanical Engineer's Branch.

133. For operating purposes, the system is divided into four divisions—Metropolitan, Southern, Northern, and Western—as shown on the accompanying map, which also indicates the various locomotive depots.

134. The rolling-stock to be maintained by the Chief Mechanical Engineer's Branch included, as at 30th June, 1923, 1,341 steam locomotives, 2,188 coaching vehicles, 21,577 freight vehicles, and 1,906 service vehicles as shown below :—

As the figures for the twelve months ended 30th June, 1924, were not available when sections of this part of the Report were prepared, it was necessary to utilise those for the previous twelve months. The 1924 figures would not materially affect the position.

135. The head-quarters of the Branch are at Eveleigh, (Sydney), where also the principal locomotive and carriage shops are established. Wagon shops are situated at Clyde in the suburbs of Sydney. While the major portion of the repairs are executed at these places, a fair amount of such work is performed at Honeysuckle Point, (Newcastle), and, especially in connection with locomotives, at various running sheds.

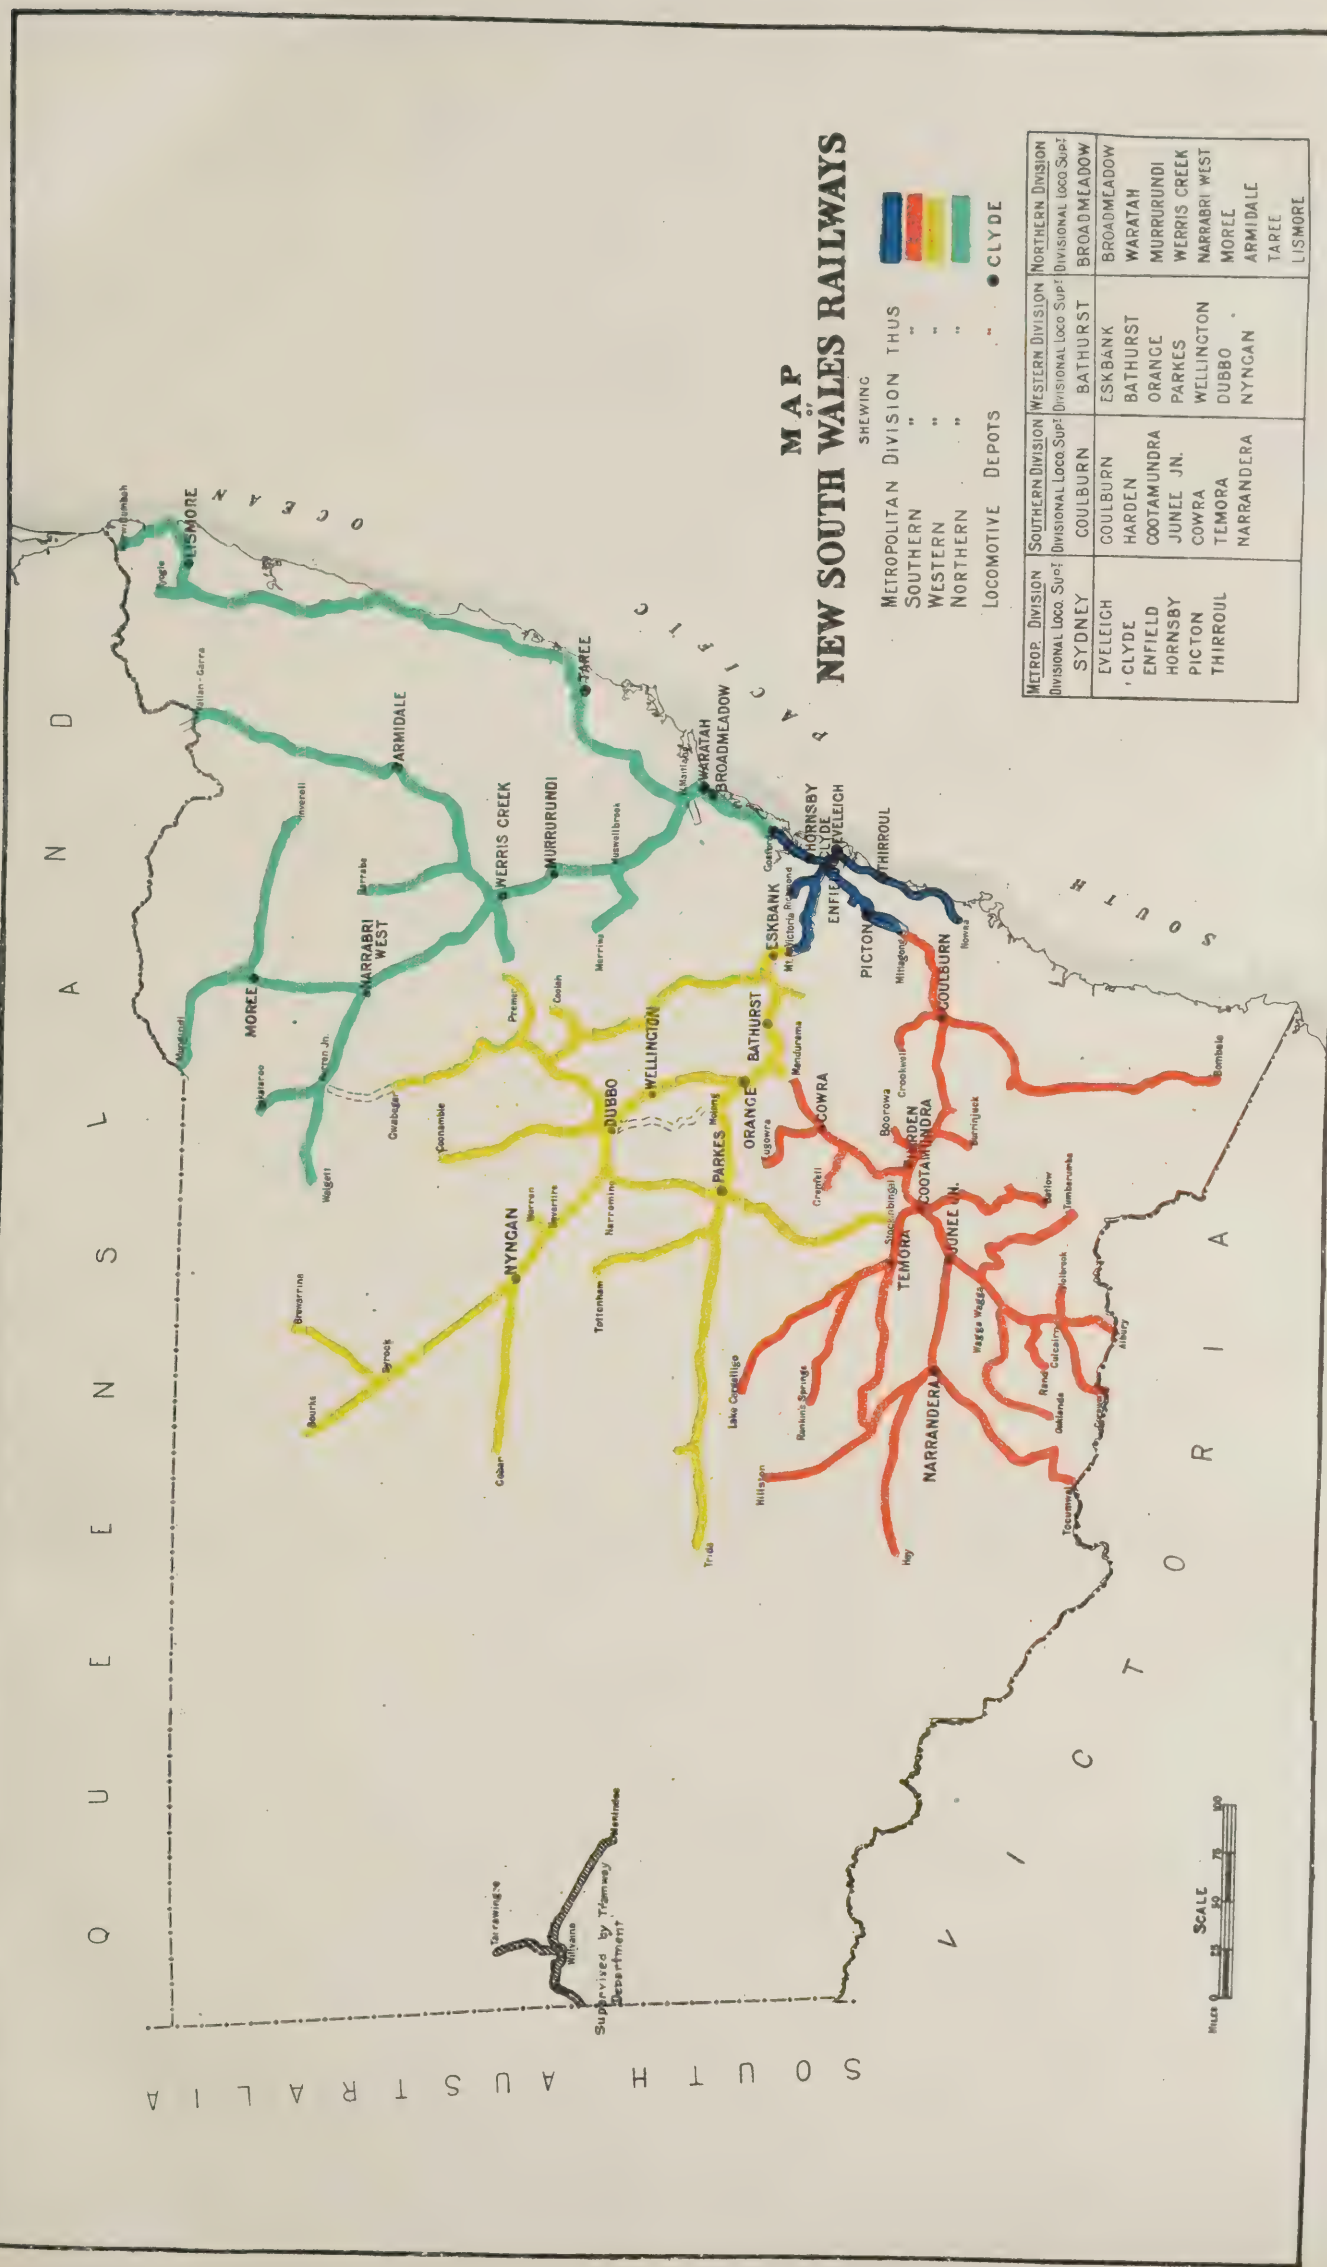

#### Locomotive, Carriage and Wagon Works.

136. The principal locomotive shops are situated at Eveleigh. They deal with the building, renewals and heavy repairs of locomotives, and also execute new boiler work for any of the other shops in which repairs are carried out.

137. At Eveleigh there is a very complete and up-to-date foundry, both for cast-iron and steel, together with a section for non-ferrous metals. This foundry is equipped with tools for machine-made castings, and over 60 per cent. of the work is performed under a bonus system of payment, which seems to give satisfaction to the men and enables the work to be carried out speedily and economically.

EVELEIGH.

### Iron Foundry.

138. All cast-iron required for locomotive and carriage and wagon maintenance is made in the foundry, as also a considerable quantity of cast-iron for the Permanent-way, Electrical and Signal Branches. The heaviest castings dealt with in average work weigh about 30 cwt., but castings up to 17 tons have been made satisfactorily, and no difficulty would be experienced in casting up to 25 tons. There is very little hand-carrying of metal, as the foundry is divided by portable tracks of about 20 inch gauge, which are arranged to serve rows of moulders on either side of each track. These tracks carry ladles of from 5 cwt. to 3 tons capacity which are filled from the cupola receivers. By the use of this method of metal pouring and moulding machines, the output of brake-shoes for one machine moulder and labourer has been brought to 300 per day of eight hours, which is, we are given to understand, six times the rate obtained when the work was done on the floor and metal was hand-poured. The machines for fire-bar moulding and piston ring moulding have been developed and built in the Eveleigh Works. We are informed by the Department that, on the former, two moulders produce per day, with the assistance of a labourer for half a day, moulds for 168 fire-bars, whereas previously two moulders produced 28 per day. The average cost of completed castings, including all shop charges, is 13s. 9d. per cwt. Recently, the practice of using semi-steel was introduced for all more important castings, such as cylinders and superheated headers. Considerable experimental work has still to be done with semi-steel, but at the present time much better metal is being obtained at lower cost than when grey iron was exclusively used.

### Steel Foundry.

139. The present steel foundry occupies about 12,400 square feet of area, but roughly 60 per cent. of this will be taken over by the iron foundry after the completion of an extension covering 22,000 square feet which will become the steel foundry. The steel foundry equipment includes :—

- 1 1-ton stock oil-fired converter.
- 4 moulding machines.
- 1 core-making machine.
- 1 drilling machine.
- 1 sawing machine.
- 2 double floor grinders.
- 1 rumbler.
- 3 chilian mills.
- 1 annealing furnace.
- 1 brick core oven.

The heaviest steel casting produced to date weighed 31 cwt. Gallery or multiple moulding is adopted extensively for small castings, and the process has been completely successful. The output for twelve months ended June, 1924, was 462 tons, equal to 11.8 lbs. of serviceable castings per man-hour. The average cost of completed castings, including all shop charges, is £1. 13s. per cwt.

140. In the new section of the steel foundry, a Greaves-Etchell 3-ton electric furnace has been installed. The addition of this furnace will enable all requirements for steel castings to be made, including a large proportion of steel centres to be supplied to contractors for the manufacture of new rolling-stock.

141. The area of the whole of the foundry—embracing iron, steel, and brass—is 69,330 square feet, but this excludes the extension of 22,000 square feet previously mentioned. The foundry should be able to deal with all the railway castings required, no matter which department calls for them. Such a scheme of concentration presents advantages from more than one point of view, and, although it has been suggested that this might mean delay to certain classes of work, we see no reason for this, provided the work is properly conducted.

### Pattern Shop.

142. The Eveleigh pattern shop stores and deals with all the patterns for the foundry. These patterns, in the aggregate, are extremely valuable, and it is unfortunate, therefore, that a better scheme of storage is not employed. In many sections the patterns are untidily stacked, and, to say the least, it must be

be a matter of difficulty and expense for required patterns to be obtained. On the New South Wales Railways, owing to the number of different classes of locomotives, coaches, wagons, and machines requiring renewal, there is necessarily a large stock of patterns, and it is our view that they should be stored on a systematic—and adequately catalogued—basis in a commodious and well protected building. We recommend that an improved arrangement along these lines should be brought into operation immediately.

#### **Forge.**

143. The forge is well laid out and equipped, and is capable of supplying all the necessary work, up to the largest forgings, in a cheap and economical manner. We noticed, however, that some of the heavy forgings were not made near enough to the template and, therefore, carried too much weight. This, no doubt, is due to the heavy press having only recently been brought into use, and the matter will probably soon be rectified.

#### **Smith's Shop.**

144. The smith's shop seems to be well equipped, and should meet all the needs of the Department. Drop-hammer work, however, might be done with advantage.

#### **Spring Shop.**

145. We understand that the spring shop supplies all the springs for the rolling-stock—locomotives, carriages, and wagons—and we find that the cost of manufacture, as compared with bought springs, is greatly in favour of the Railway Department doing the work. The spring failures, however, appear to be heavy, and this will be remarked upon in another part of the Report.

#### **Machine Shop.**

146. The machine shop has a good proportion of up-to-date and satisfactory machines. A good deal of attention, we should judge, has been given to this. The machines are driven by electric motors, the shafting being arranged in groups where one machine is not of sufficient size to require a separate motor. The layout of these seems in every way suitable.

#### **Method of Dealing with Locomotives coming in and under Repair.**

147. The method of dealing with locomotives under repair, and of following up the work may be described as follows:—

148. The general condition of engines is reported monthly by steam shed inspectors to the Locomotive Superintendent, and, in addition, special reports are forwarded whenever necessary, advising the exact condition of engines in need of general repairs. When the Locomotive Superintendent directs that an engine shall be stopped, a repair sheet—giving particulars of all visible necessary repairs—is prepared by the steam shed inspector concerned and forwarded to the Chief Mechanical Engineer, who holds complete records of the history of each locomotive and its boiler. After the addition of information concerning mileage and time since last repair, the repair sheet is forwarded to the Works Manager, and by him to the foreman erector of the shop in which the repairs are to be undertaken.

149. The works at Eveleigh contain three separate erecting shops, known as the new locomotive shop, the old erecting shop, and the large erecting shop. The work in the machine and fitting shops is sectionalised as far as possible, complete equipment being installed in each section to deal with all operations necessary within that section. After an engine is stripped, the wheels, axle-boxes, side-rods, valve motion, piston valves, air pumps, boiler mountings, &c., are delivered to the respective sectional sub-foremen, each of whom is responsible for completely repairing one particular part or group of parts.

150. As an aid to the speedy execution of locomotive repairs, a number of spare parts are maintained so that an engine need not be kept waiting for the repair of the particular parts stripped from it. This applies more especially to boilers, axle-boxes, and wheels.

151. If, from the information given on the repair sheet the necessary repairs are of a light nature, such as repairing a fractured frame or renewing tyres, or any light work not involving the complete stripping of the engine, the foremen of any shops where parts for such an engine are to be repaired are advised (form marked "A") of the fact that the engine is to be treated as a running job, and they have instructions that work for such engines is to take precedence of other work in order to get the engine speedily back into traffic.

## FORM "A."

Foreman.

observed after stripping. From the information made available by the engine repair sheet, by the defect list, and from his own personal observation, the Locomotive Works Manager fixes the time considered by him as reasonable for the completion of repairs. These times vary from eighteen days for the smaller engines to fifty days for re-building or converting from simple to superheated engines of the heavier classes. After the scheduled time for the engine repair has

has been determined, copies of form "C" are made out covering all the parts of the locomotive to be repaired in the sectional shops, and showing the dates on which the part or parts must be supplied in completed state to the erection shop. As far as practicable, the sequence is fixed to ensure delivery most advantageous to the foreman erector. When sectional work is completed, the sub-foreman fills in the form and delivers it to his foreman. Should there have been any delay, the reason is noted.

Loco. Works Manager.

192 \_\_\_\_\_

153. The schedule officer maintains two records of the progress of repairs, one made up from the return of completed forms, similar to form "C," and a record card, "D," which is kept posted daily from his own personal observation. These records are analysed periodically by the Works Manager and his assistant, and any sections in default for late delivery of material are discovered and suitable action taken. The Assistant Chief Mechanical Engineer holds a meeting weekly with the Locomotive Superintendent and Works Manager, and reviews the output of repaired engines for the previous week and all delays to engines under repairs.

154. A complete system of inter-shop transport has been developed to facilitate delivery of material between erecting shops and machine and fitting shops, and includes an elevated electric runway cantilevered from the shop front, and having branch access to all necessary shops. There are three electric storage battery shop delivery trucks and a caterpillar tractor in service for moving parts from shop to shop, whilst a further three electric trucks are on order. Five high-speed standard gauge steam locomotive cranes are employed to do all the heavy lifting to and from shop trucks outside the shops and in places not served by shop cranes.

155. Assuming the arrangements outlined are followed and the progress system is carefully supervised, the repairs should be dealt with in such a way as to get the maximum quantity carried out within the works. The practice in force in New South Wales has been dealt with in some detail, as it is felt that the organisation for bringing in engines for repair and carrying them through is of the greatest importance.

No Standard Gauges in Use.

156. It is, however, noted with regret that no system of standard gauges obtains, either in the machine shop or in the fitting shop, and no interchangeability of parts can, therefore, be relied upon. This, of course, reflects itself in delay and high maintenance costs.

**Boiler Shops.**

157. The boiler shops are quite inadequate, and are costly, but we shall not deal with these in any detail, as they will shortly be transferred to an entirely new site at Chullora. The plans, layout, and buildings for the new boiler shop—which we have seen—appear generally satisfactory and of sufficient size to account fully for all the present and immediate needs, inasmuch as the electric traction proposed will mean a reduction rather than an increase in boiler requirements for some considerable time.

**New Engines.**

158. So far as the building of new engines is concerned, this is not being attempted seriously owing to the large amount of repairs required, which the shops at Eveleigh cannot at present deal with fully.

**Honeysuckle and Out-Stations.**

159. There are a certain number of repairs of a light, medium, and heavy nature carried out at Honeysuckle (Newcastle). We consider these shops are inadequately laid out and equipped for economically dealing with the work, and if the repairs now carried out there cannot be dealt with at Eveleigh—which is only 100 miles away—new and better arranged and equipped works should be provided at or near Honeysuckle. There is also a power station at Bullock Island, Newcastle, and six electric cranes of 15 tons capacity, and seventeen hydraulic cranes, also of 15 tons capacity, to deal with the coaling at the docks. The staff employed in the power-house, and also on the maintenance of the mechanical portion of the cranes, is controlled by the Locomotive Branch. The coal shipped approximates 5,000,000 tons annually.

**Staff Comparisons.**

160. Before leaving the locomotive workshops at Eveleigh and Honeysuckle, it is interesting to compare the number of men employed at these places with those at Horwich, Crewe, Derby, and St. Rollox on the London, Midland and Scottish Railway of Great Britain. It will be seen from the following statement that the staff employed per engine repaired on the British Railway was about half the number required in New South Wales. This should be given very careful consideration by the Chief Mechanical Engineer. Unless the position in New South Wales is due to the old and varied classes of locomotives it would appear that a considerable reduction could be made in the staff. For instance, comparing with Horwich, where there are practically similar works to Eveleigh (including manufacture of steel castings), it will be noticed that, while the staff is much the same, the number of repairs carried out at Eveleigh is about half, and that, in addition, twenty-one engines were built at Horwich compared with five at Eveleigh. It is important to note that, while less than half the work is done at Eveleigh as compared with Horwich, the amount paid in wages is approximately 80 per cent. more:—

LOCOMOTIVE WORKSHOPS—STAFF AND OUTPUT—1923.

Workshop.	Staff.	Engines which underwent heavy repair.	Staff employed per heavy repair.	Engine Repairs (Heavy and medium).	Staff employed per engine repaired.	Engines built.
<i>London, Midland and Scottish Railway—</i>	No.	No.	No.	No.	No.	No.
Horwich ... ..	3,885	808	4.81	888	4.38	21
Crewe ... ..	7,687	1,478	5.20	1,841	4.18	30
Derby ... ..	4,659	1,300	3.58	1,347	3.46	10
St. Rollox ... ..	1,779	359	4.96	407	4.37	...
<i>New South Wales Railways—</i>						
Eveleigh ... ..	3,476	352	9.88	447	7.78	5
Honeysuckle ... ..	410	35	11.71	49	8.37	...

161. The following are the particulars of the staff employed in connection with the repairs to locomotives at the workshops at Eveleigh, Honeysuckle and Lismore. Lismore is a small shop dealing with the repairs which, owing to its isolated

isolated position between Murwillumbah and Grafton—a distance of 147 miles—are obliged to be carried out there until the bridge is built which is in contemplation over the River Clarence.

Workshop.	Officers.	Clerical Staff.	Wages Staff (other than running).	Total.
Eveleigh Locomotive shops ... ..	93	46	3,430	3,569
Honeysuckle ... ..	16	8	402	426
Lismore ... ..	5	2	38	45
Newcastle Power Station ... ..	...	...	27	27

162. A number of light and medium repairs are done at the out-stations. This is neither desirable nor economical, and cannot be excused on account of the distance from head-quarters, as engines requiring repairs can always be arranged to work trains to the place where the workshops are situated.

#### Running Department.

163. The Running Department is directly under the supervision of the Locomotive Superintendent, who is responsible to the Chief Mechanical Engineer for the whole of the running sheds, and the repairing and maintenance of the locomotives stabled there. He has under him one principal assistant and four divisional locomotive superintendents, as shown on the organisation chart at paragraph 132. The running of the passenger engines is arranged by the Locomotive Superintendent, but running control of goods engines is entirely in the hands of the Traffic Department.

#### Repairs at Out-Stations.

164. A considerable amount of repair work is done at the out-stations, and many of them are equipped with the necessary machinery for this work. The value of this machinery is put down as approximately £90,000. It is uneconomical and in every way undesirable that repair work should be carried out at many separate places the methods at which might vary considerably, and, as stated elsewhere, it is recommended that repair work should be concentrated as far as practicable.

165. The system has grown up in New South Wales by reason of the difficulties in the direction of enlarging the accommodation at Eveleigh, which was built in 1888 when there were only some 400 engines in service. Land was more readily available at places outside Sydney, and, in addition, it was then the policy to instal certain machinery in the existing running sheds as being less expensive than the erection of suitable workshops. As a result, the practice adopted has led to increased maintenance costs and has also had a great effect upon standardisation. In the case of Honeysuckle Works, these were built prior to the Eveleigh Shops in connection with the separate railway then in existence from Newcastle to the north. The following statement clearly shows how engine repair work has grown at the out-stations and decreased at Eveleigh during recent years.

#### TOTAL WAGES CHARGED TO ENGINE REPAIRS.

Date.	Eveleigh.	Honeysuckle.	Other Depôts.
	%	%	%
1910-11	60.44	5.77	33.79
1911-12	59.63	5.72	34.65
1912-13	58.41	5.36	36.23
1913-14	55.89	5.16	38.95
1914-15	53.31	5.01	41.68
1915-16	55.32	5.37	39.31
1916-17	54.71	5.27	40.02
1917-18	50.92	4.11	44.97
1918-19	50.00	4.36	45.64
1919-20	49.52	4.84	45.64
1920-21	51.18	4.66	44.16
1921-22	50.74	4.68	44.58
1922-23	50.65	5.19	44.16
1923-24	49.50	5.94	44.56

166. There is very little covered-in accommodation at the running sheds, which are principally of the round-house type, but, on account of the climate, a good deal of the work can conveniently be dealt with outside. In time, when the repairs are removed to head-quarters, as has been suggested, the present covered-in portion will in most cases be sufficient, as it is thought that nothing but ordinary running repairs should be effected at out-stations.

#### Number of Running Sheds.

167. It is an advantage to reduce the number of running sheds as far as possible, with due consideration to traffic conditions, and the exigencies of the working. While we consider it advisable to draw attention to the point, we make no definite recommendations in this regard.

#### Future Control of Loco. Running.

168. In our view, the Traffic Superintendent, together with the Mechanical Assistant in each area, should be responsible for the economical working of all the locomotives when out in traffic, and, to this end, under the suggested area scheme of organisation, the Mechanical Assistant should be responsible to the Area Assistant Commissioner as well as to the Chief Mechanical Engineer.

169. It will be seen from the following statement that quite a substantial staff is employed at the various running sheds in connection with the repair of locomotives, and, if such repairs were transferred to head-quarters, it is considered that saving in staff would be effected. The statement also includes the number of drivers, firemen, cleaners, &c., stationed at the several sheds :—

Drivers, firemen, cleaners, &c., stationed at the sheds.				Running Staff.			Total Staff.

### Carriage Shops.

170. The carriage shops, which are also situated at Eveleigh, are congested and are laid out in a way which makes it difficult to pass a large number of vehicles through with the speed desirable. When the alterations to the railway in connection with the electrical service are completed, the difficulties in the carriage shops will largely be increased.

171. There are a number of up-to-date and useful machines in the carriage shops, and, on the whole, no exception can be taken to the work done, but, as before stated, they are congested and consequently not laid out so as to deal with the work in sequence and in the most approved way, thus causing a certain amount of delay and expense which would otherwise be avoided.

172. In view of the carriage stock being inadequate—even for existing requirements—and of the defects in the present shops, it is very desirable that these should be the next removed to the new site at Chullora, more especially as the shops for the new electrical stock are at present being put up there.

173. Details of the staff engaged in the repairing of carriages are set out hereunder :—

Workshop or Running Shed.	Officers.	Clerical Staff.	Wages Staff.	Total.
Eveleigh Carriage Shops ... ..	39	27	1,213	1,279

### Wagon Shops.

174. The principal wagon shops are situated at Clyde. No building of new stock is carried out there, the whole of the works being devoted to wagon repairs. Most of the wagon repairing is done in the open—only one small shop, 166 feet long by 61 feet wide, with four roads, being reserved for extra heavy repairs. The other shops are devoted to wheel turning and to such blacksmith and carpentry work as is necessarily attached to wagon repairing. We are assured that, on account of the climate, it is unnecessary to have shops for wagon repairs, but we are of the opinion that at the principal wagon repair depôt more covered accommodation would be an advantage.

175. Certain repairs are carried out at different parts of the railway system, such as Enfield, Bathurst, Lismore, &c., and, so far as wagon repairs are concerned, this is an advantage, as it is very desirable to deal with them speedily and as near as possible to the place at which they are required.

176. The staff employed in connection with repairs to wagons is as follows:—

Workshop or Running Shed.	Officers.	Clerical Staff.	Wages Staff.	Total.
Clyde Wagon Shops ... ..	18	10	726	754
Honeysuckle ... ..	...	...	46	46

#### Multiplicity of Locomotive Types.

177. In visiting the workshops and running sheds and noticing the various types of engines, both ready for work and undergoing heavy and light repairs, one cannot help being struck with the great variety of types—some of which are very antiquated—and also with their dirty and untidy condition. Some of these engines have been in existence for fifty-nine years, and the average age of those on the line to-day, viz., 1,391, is twenty-two years. When it is pointed out that 39·38 per cent. of these engines have been built during the last ten and three-quarter years, it will be understood what ancient machines some of the remainder must be, with an average age of twenty-eight years.

#### New Locomotives and Maintenance Considerations.

178. During the period of ten years prior to and including June, 1923, the Commissioners have found it possible to increase their locomotives from 998 to 1,341, or 34·37 per cent. of the stock in 1913, and, in view of this, it is difficult to understand

understand the complaint of the great difficulty in getting materials, &c., for the necessary repairs and maintenance of their locomotives. A statement showing the increases is given hereunder :—

Twelve months ended June.	Number of Locomotives.	Miles open for traffic.
1913	998	3,930
1914	1,065	3,967½
1915	1,162	4,134½
1916	1,211	4,188
1917	1,275	4,437
1918	1,282	4,679½
1919	1,279	4,824½
1920	1,279	5,015½
1921	1,301	5,042½
1922	1,321	5,116
1923	1,341	5,317½
Inc. 1923 over 1913	34·37%	35·31%

It is true that in 1919 and 1920 nothing was done in the way of increasing the stock, and it may be assumed that at that time difficulties arose with regard to material, but in 1921 the stock again began to increase. The railway lines open for traffic, it will be noticed, have also increased by 35·31 per cent. in the same period. The opening and equipping of these lines for traffic must have meant a considerable usage of material of various kinds, and it might fairly be argued that the maintenance should have been of first importance. The Chief Mechanical Engineer himself states "that the whole locomotive position has been considerably influenced, firstly, by the incidence of the war and the high prices which obtained after the armistice and until quite recently."

#### Locomotive Branch Efficiency Factors.

179. In considering the Locomotive Department, there are three factors which stand out pre-eminently, and certainly require special consideration. These are (1) the high cost of maintenance, (2) the unusually large number of engine failures, and (3) the excessive coal consumption.

180. Maintenance costs can be reviewed from two points of view—by comparing a period in 1913 with 1923, and judging the results after making due adjustments for the increase in cost, both of wages and material, and also by using the maintenance figures of New South Wales and drawing a comparison with other railways, either in Australasia, in Great Britain, or even in America. The difficulty of justly comparing operations on railways working under different conditions is appreciated, but it is only by such comparisons that avenues of inquiry may be opened up.

181. As a result of our tours over the system and inspection of various running sheds, we are forced to the conclusion that high maintenance costs must be the consequence of the many classes of engines—some quite out of date—and the conditions under which they were being overhauled. It was quite common to see hot smoke-box doors, while an unusually large number of locomotives were seen with the gear taken down for heated or worn brasses, &c.

182. An examination of the costs fully justifies the conclusions at which we had arrived. Locomotive maintenance cost for the twelve months ended 30th June, 1914, was £612,521, and the stock of locomotives 1,065, giving an average cost per engine in stock of £575. For the twelve months ended 30th June, 1923, the maintenance cost was £1,671,400, the stock 1,341, and the average cost per engine £1,246. To the 1914 figures should be added the 1923 increased percentages in respect of the higher wages and dearer material. These are, wages 66·13 per cent. and material 69 per cent., making the maintenance cost £1,023,009 and the average cost per engine £961, which compares with the figure of £1,246, for the twelve months ended 30th June, 1923.

Cost

### Cost Comparison with 1914.

183. These figures show that the costs have increased, when worked out on a similar basis, as much as £285 per engine, and this unsatisfactory result follows the institution of a bonus system in 1917 and the expenditure of a large sum in new machinery. The only explanation given to us was the larger engines which had had to be repaired, but it must not be overlooked that those engines are the latest built, and ought to require a comparatively small amount of repair for some years after being put into traffic. If even the same cost per engine as in 1914 had been upheld—after due allowance for the higher wages and dearer material—the saving to-day would have been £396,435 per annum.

184. We now pass to the differences which may be discovered between the New South Wales cost and that of other railways in Australasia and in Great Britain. These are given in the following table :—

Maintenance of Locomotives, 1923.

Company.	Cost of Maintenance.	No. of Locomotives.	Average cost per Locomotive.	Revised on basis of English Costs.
	£		£	£
New South Wales ... ..	1,671,400	1,341	1,246	721*
Victoria... ..	669,666	789	849	491†
Queensland ... ..	457,974	698	656	380†
South Australia ... ..	394,437	494	798	462†
Western Australia ... ..	222,282	421	528	306†
New Zealand ... ..	501,172	639	784	454†
Great Western ... ..	2,043,309	3,944	518	.....
London and North-Eastern ...	3,742,859	7,398	506	.....
London, Midland and Scottish	5,358,986	10,292	521	.....
Southern ... ..	1,135,477	2,258	503	.....

\* This figure has been compiled on the basis of wages being 100 per cent. higher than in England and material 35 per cent.

† Reduced in the same ratio as in the case of New South Wales.

From the English costs must be deducted the cost of painting the locomotive.

185. The figures in the foregoing table show that the maintenance costs in New South Wales are high when compared with those of other railways. When questioned on these costs (Q. 2514), the Chief Mechanical Engineer said the only explanation he could give—outside the present methods of dealing with repairs and the ancient rolling-stock—was that more powerful engines had been put into service during recent years, and also that engines had been improved by superheating. As, however, we have previously pointed out, these larger engines are the latest built, and consequently should require small repairs, if any, to their boilers, and certainly be the lowest in general repairs on account of the short time they have been in traffic. Consequently the explanation given is one we cannot accept. So far as superheating is concerned, moreover, all the British railways have done more in this direction than the New South Wales railways.

### High Average Age of Boilers.

186. Reference has also been made to the fact that the water is bad, and that this has a serious effect on the locomotives. At the same time it is agreed that the matter has been investigated carefully, and that various methods have been adopted to deal satisfactorily with the water. While it is admitted that bad water is detrimental to effective and economical locomotive maintenance on any railway, the fact remains, as shown in the following table, that the life of the boilers condemned in 1923 averaged over sixteen years, this being a longer average life than is usual on British railways. Most railways have considerable trouble with water on various parts of their system, with which they have to deal to prevent disastrous results, but, from the evidence we have received, and our own observations, we cannot agree that this is a sufficient reason for the relatively high maintenance costs.

Details

Total—67 boilers.

Average age 16 years 4 months.

**Engine Failures.**

187. The question of engine failures requires close attention. A failure is measured in railway practice when time is lost by a train due to the engine having some defect which prevents it from keeping the scheduled time, no matter what the cause may be. This is usual on most railways, and on those in New South Wales if a passenger train loses five minutes, or a freight train ten minutes, through the fault of the locomotive, a failure is recorded against it. On the London and North-Eastern Railway, Great Britain, with which line we propose to make comparisons, the practice is five minutes delay all round—both passenger and freight.

188. The comparison is by the number of failures to the train miles run. On the New South Wales railways the train mileage has added to it light and assisting miles, while on the British railway both these are eliminated. This gives a greater advantage in mileage to the Australian railways, while they also get the allowance of ten minutes instead of five so far as freight trains are concerned. The figures are for the twelve months ended 30th June, 1923, in the case of New South Wales, and for the London and North-Eastern Railway the year 1923. They show that in New South Wales there was one failure for every 4,225 miles run, and in the case of the British railway one failure for every 39,863 miles run. This confirms the opinion we had formed when considering the condition of the locomotives that the failures would be high.

189. Bad water is given as one of the reasons for these failures, but, in our view, the water which causes failures can be dealt with. It was stated in evidence by the Chief Mechanical Engineer (Q. 2581) that means had been taken to deal with the water at various places.

190. In a statement handed in by the Australian Federated Union of Railwaymen they draw very forcible attention to the dirty condition of engines and point out the impossibility of making a close examination. Our own observation bears this out.

191. The question of lubrication has been raised and careful consideration has been given to the points brought out. In all the circumstances we see no reason to make any departure from the practice now adopted, which appears to give satisfaction to the Chief Mechanical Engineer.

192. Notice must be taken of the spring failures, which appear to be unusually high. In ten months there were found broken in the locomotives of New South Wales 2,912 springs, and, as will be seen from the evidence of the Chief Mechanical Engineer, he does not consider it a large quantity (Q. 2563). We can hardly agree with this. What is exactly the cause should be the subject of very serious investigation, as we feel confident that means can be found to reduce this number very materially.

#### Coal Consumption.

193. In dealing with the question of coal consumption, it was found that no system is in force for the weighing of coal to be used by locomotives. This is also brought out in the evidence given by the Chief Mechanical Engineer (Q. 2586A). He stated (Q. 2593) that the existing practice is to accept the estimate of the fuelman who puts the coal on the tender. No kind of record is kept of his estimate and little reliance can, therefore, be attached to it from the point of view of estimating coal consumption for any particular engines. In our opinion it is both desirable and necessary to introduce a means by which coal supplied to individual locomotives can properly be weighed or closely estimated. This should not involve any great expense, and we are convinced that some expenditure would be justified by the results obtained.

#### Comparative Costs of Coaling Engines.

194. The method adopted in regard to the placing of coal upon the tenders varies at several of the depots. In certain instances the coal is loaded by hand from truck or stage; in others, hand-filled skips are tipped to the tender; again bunkers are filled by conveyor belts and the coal gravitates to the tenders by chutes, &c., as will be seen from the statement set out hereunder:—

Handling of Coal, May, 1924.

Depôt.	Method of Loading Coal into Tender.	Tonnage placed on Tenders.	Handling Costs per ton.
Eveleigh Elevator ...	Bunker filled by conveyor belt—Gravitates to tender by chutes.	19,953	d. 4·7
Eveleigh ...	Hand-filled skips tipped to tender ...	5,045	23·2
Hurstville ...	By hand from truck or stage to tender ...	726	11·4
Homebush ...	By hand from truck or stage to tender... ..	807	10·3
Sydney ...	By hand from stage to tender ... ..	2,255	17·2
Enfield ...	Coal bunker filled by trucks propelled up ramp and coal gravitates to tender by chute.	9,573	3·1
Penrith ...	Coal bunker filled by conveyor buckets. Gravitates to tender by chute.	1,023	6·4
Valley Heights ...	Coal bunker filled by trucks propelled up ramp, and coal gravitates to tender by chute.	1,642	2·8
Thirroul ...	Coal bunker filled by trucks propelled up ramp, and coal gravitates to tender by chute.	2,422	2·1
Clyde ...	By hand from truck or stage to tender ... ..	1,547	18·8
Hornsby ...	By hand from truck or stage to tender ... ..	3,263	17·5
Milson's Point ...	By hand from truck or stage to tender ... ..	1,199	11·8
Picton ...	By hand from truck or stage to tender ... ..	484	17·3
	Total, Metropolitan ... ..	49,939	8·5

Handling of Coal—*continued.*

Depot.	Method of Loading Coal into Tender.	Tonnage placed on Tenders.	Handling Costs per ton.
South Goulburn ...	Coal bunker filled by trucks propelled up ramp, and coal gravitates to tender by chute.	2,965	d. 5·8
Goulburn ...	Priestman's Coal Crane, with grab and buckets (partly by hand).	2,778	11·9
Harden ...	Coal bunker filled by trucks propelled up ramp, and coal gravitates to tender by chutes.	3,760	1·8
Demondrille ...	Coal bunker filled by trucks propelled up ramp, and coal gravitates to tender by chute.	1,878	2·4
Cowra ...	Coal bunker filled by truck propelled up ramp, and coal gravitates to tender by chutes.	1,987	1·9
Cootamundra ...	By hand from truck or stage to tender ... ..	912	11·7
Temora ...	By hand from truck or stage to tender ... ..	721	16·4
June ...	By coal crane with buckets, and partly by hand ... ..	5,344	18·1
Albury ...	By hand from truck or stage to tender ... ..	750	16·4
Culcairn ...	By hand from truck or stage to tender ... ..	418	12·8
Narrandera ...	By hand from truck or stage to tender ... ..	716	11·6
Total, Southern ... ..		22,229	9·5
Lithgow ...	Hand-filled coal skips tipped to tender from elevated stage...	5,612	11·3
Wallerawang ...	By hand from truck or stage to tender ... ..	743	15·0
Mudgee ...	By hand from truck or stage to tender ... ..	904	12·4
Bathurst ...	Hand-filled coal skips tipped to tender from elevated coal stage.	4,158	14·7
Orange ...	By coal crane with clam-shell bucket (partly by hand) ...	1,356	13·9
Parkes ...	By hand from truck or stage to tender ... ..	988	16·2
Wellington ...	By air hoist, and buckets hand filled ... ..	1,496	13·8
Dubbo ...	By hand from truck or stage to tender ... ..	1,508	15·4
Nyngan ...	By hand from truck or stage to tender ... ..	575	13·8
Total, Western ... ..		17,340	13·5
Broadmeadow ...	Coal bunker filled by trucks propelled up ramp, and gravitate coal to tender by chute.	12,176	5·1
Singleton ...	By hand from truck or stage to tender ... ..	762	14·0
Port Waratah ...	Coal bunker filled by trucks propelled up ramp, and gravitate coal to tender by chutes.	5,801	1·6
Taree ...	By hand from truck or stage to tender ... ..	2,664	15·0
Murrurundi ...	By hand from truck or stage to tender ... ..	934	21·4
Werris Creek ...	Coal bunker filled by trucks propelled up ramp, and gravitates coal to tender by chute.	5,565	4·4
West Tamworth ...	By hand from truck or stage to tender ... ..	294	12·7
Narrabri West ...	By coal crane and clam-shell buckets (partly by hand) ...	1,272	12·2
Moree ...	By hand from truck or stage to tender ... ..	481	16·6
* Armidale ...	By "Holman" coaling plant conveyor belt to bin, and gravitates to tender.	2,741	15·4
Tenterfield ...	By hand from truck or stage to tender ... ..	790	22·6
Total, North ... ..		33,480	7·4
Grand Total ... ..		122,988	9·1

\* Armidale is also supplied with coal crane and clam-shell bucket.

195. It will be observed that the handling costs per ton of coal placed on the tenders differs very considerably at the several depots, ranging in respect of the month of May, 1924, from 1·6d. at Port Waratah, where the coal bunker is filled by trucks propelled up the ramp, the coal gravitating to the tender by chutes, to 23·2d. at Eveleigh, where hand-filled skips are tipped to tender. In our opinion it is desirable to arrange as far as possible for the standardisation of the method of loading coal into tenders, and as, generally speaking, the handling costs appear to us to be excessive, we consider that close attention should be given to this point.

Cost

**Cost of Coaling Appliances.**

196. The cost of coal loading appliances is set out below :—

Depot.	Nature of Appliance.	Capacity of Bunker.	Cost of Appliance.	Remarks.
		tons.	£	
Eveleigh Elevator ...	Bunker filled by conveyor belt. Coal gravitates to tender by chutes.	1,500	20,703	The only mechanical handler on the system.
Enfield ...	Bunker filled by trucks propelled up ramp. Coal gravitates to tender by chute.	1,600	15,013	.....
Valley Heights ...	" "	300	6,294	.....
Thirroul ...	" "	400	4,871	.....
Demondrille...	" "	1,000	20,024	Also includes expenses in connection with ash handling pits, &c.
South Goulburn ...	" "	800	13,603	Expensive earthworks necessary.
Harden ...	" "	1,200	10,527	.....
Cowra ...	" "	800	11,927	.....
Broadmeadow ...	" "	1,000	14,343	.....
Port Waratah ...	" "	550	7,623	.....
Werris Creek ...	" "	800	9,902	.....

197. Excluding the Eveleigh Elevator, the cost of the appliances installed amounted to £114,127, and the coal placed on tenders during May, 1924, at the ten depots enumerated was 47,769 tons, the handling costs averaging 3·65d. per ton. At the other depots (excluding Eveleigh Elevator) the coal placed on tenders was 55,266 tons, and the handling cost 15·42d. per ton. The difference in the costs is so noticeable that it would appear desirable for immediate consideration to be given the installation of these appliances at certain other depots, especially where large quantities of coal are handled as at Hornsby, Sydney, Dubbo, Clyde, Taree, &c.

**Coal Consumption Comparisons.**

198. As a means of emphasising our view that the coal consumption on the New South Wales Railways is excessive, comparisons have been made on an engine mile basis with certain other railways in Australasia and in Great Britain, with the following result :—

Consumption of Coal, 1923.

Company.	lbs. per Engine Mile.
New South Wales ...	85·18
Victoria ...	73·19
Queensland ...	60·70
South Australia ...	51·43
Western Australia ...	93·80
New Zealand ...	56·76
Average, Australasia	72·00
Great Western ...	46·19
London and North-Eastern ...	58·05
London, Midland, and Scottish ...	58·61
Southern ...	45·71
Average, Great Britain	54·85

199. When it is realised that if the coal consumption per engine mile in New South Wales had been at the same rate as the average for Australasia—the latter being much higher than the average for Great Britain—the annual saving would be at the rate of £122,258, it will be recognised that there is urgent need for considerable improvement.

200. The reasons given for the excessive consumption of coal in New South Wales are :—(1) The large tractive effort of the engines; and (2) the difficult roads to be negotiated both with regard to curves and grades. These reasons, however, do not appear to us to justify the high coal consumption.

**Tractive**

**Traction Effort in Relation to Coal Consumption.**

201. The traction effort on the New South Wales Railways is 23,751 lbs. (Q. 2603), and on the London and North-Eastern Railway 20,120 lbs. Increasing the coal consumption figure on the latter railway in the same ratio as the traction effort bears to that of the New South Wales Railways, the result would be a consumption of 68.53 lbs. per engine mile, as against 85.18 lbs. in the case of New South Wales. It will be seen that the difference is still considerable, and, on the engine mileage run during the twelve months ended 30th June, 1923, there would have been a saving of £154,446 if the New South Wales consumption had been on the same level as the amended L. and N.E.R. figure.

**Curves and Grades.**

202. We do not overlook the difficulty of a frequent decrease or increase of load over varying grades, but if all possible regard be had to the grades and curves of the sections over which engines have to run, we are of opinion that the coal consumption per engine mile, as compared with other systems, is not accounted for by the physical aspect of the New South Wales Railways. There is no doubt a certain amount of punishing of engines—due in all probability to the age of a number of them rendering them unfit for strenuous service—and this is reflected in the number of burnt smoke-box doors we have observed, while it has a bearing not only upon maintenance costs, but also upon coal consumption.

203. It will be seen in the evidence given by the Chief Mechanical Engineer (Q. 2596) that he is not at all satisfied with a comparison made on an engine mile basis. The coal consumption per 1,000 gross ton-miles, which he suggested as a more accurate basis of comparison, is not kept on the railways of Great Britain, but, as the Chief Mechanical Engineer had referred to the Eastern District of the United States of America (Q. 2606), as being more nearly comparable with the railways here, we have obtained the figures relating to that district, the comparison being as follows:—

Consumption of Coal per 1,000 Gross Ton-miles (including Engine and Tender).

	lbs.
Eastern District of United States of America ... ..	159.00
Western District of United States of America ... ..	160.00
Southern District of United States of America ... ..	165.00
Average—United States (Class 1 Railways) ... ..	161.00
New South Wales Government Railways ... ..	290.33

204. Steam blowing from packing and various parts of the locomotives, as also from wasting steam through the safety valves, the latter due to neglect in having the steam pressure too high, add to the coal consumption. We have noticed a very large number of engines wasting steam in this way, and suggest that special instructions be given to prevent such unnecessary consumption.

205. We are undoubtedly of opinion that the consumption of coal is excessive, and that no means exist of discovering which locomotives or groups of locomotives are the worst offenders, inasmuch as no attempt is made to find out the coal consumption except as a whole. As this is a weakness which should be cured before it develops more seriously, we recommend that careful consideration should be given to the question, as we are confident the coal consumption can be reduced.

**Coaching Stock.**

206. We are of opinion that the railways are inadequately equipped with coaching stock at the present time, and this is borne out by the evidence of the Chief Mechanical Engineer and the Chief Traffic Manager. The Chief Mechanical Engineer states further that, by the end of 1926, the Commissioners anticipate obtaining 300 suburban carriages for the electrical service, by which time they expect to dispose of an equal number of old vehicles. It is true that the seating and standing accommodation of the new stock will be greater than that which will

will be retired, nevertheless, if electrification bears out past experience—and traffic density increases as a direct consequence of improved facilities—then the better seating accommodation will not put the Department in any stronger position so far as stock is concerned.

207. There are at the present time 107 different types of coaching stock, some of which are very old and should be replaced. The Chief Mechanical Engineer in his evidence (Q. 2867) stated that he expects to reduce these to twenty different classes. In view of this, it must be acknowledged that a number of carriages should be built without delay over and above those to be used on the electrical service.

208. It has already been pointed out that the shops are quite unfit to deal with the maintenance and renewals required at present, and, as the number of vehicles should be increased, the position will become more acute. The building of new carriage shops at Chullora is, therefore, vital, and cannot be too strongly urged.

209. The cost of maintaining the carriage stock is high, as will be seen from the following particulars:—

Maintenance of Coaching Vehicles—1923.

Company.	Cost of Maintenance.	No. of Coaching Vehicles.	Average cost per Vehicle.	Revised on basis of English Costs.
	£		£	£
New South Wales ... ..	419,789	2,188	192	112*
Victoria ... ..	405,252	2,587	157	92†
Queensland ... ..	151,663	1,042	146	85†
South Australia ... ..	128,491	716	179	104†
Western Australia ... ..	60,141	485	124	72†
New Zealand ... ..	191,774	1,498	128	74†
Great Western ... ..	809,984	10,139	80	.....
London and North Eastern ... ..	1,804,814	21,218	85	.....
London Midland and Scottish ... ..	1,998,406	26,603	75	.....
Southern ... ..	715,561	10,073	71	.....

\* This figure has been compiled on the basis of wages being 100 per cent. higher than in England and material 35 per cent.  
† Reduced in the same ratio as in the case of New South Wales.  
From the English costs must be deducted the costs of painting the vehicles.

210. In his evidence, the Chief Mechanical Engineer quoted a figure of £112 (Q. 2822) as the average cost per vehicle for the coaching stock in Great Britain. He has, however, since agreed that he had included items which were not at all comparable, and the figure as now accepted stands at £80. No doubt, if suitable shops were provided and the old stock replaced, a considerable reduction in the maintenance costs would result.

Wagons.

211. It is not the practice for the Railway Department to build new wagons. When they are required, the construction is let out to contractors who deliver the trucks as early as possible. The Estimates, however, are passed so late in the year that, as the contractors have to get their material from abroad, it seems from the evidence given by the Chief Mechanical Engineer that sufficient trucks cannot be procured. We consider this should be obviated, but, in view of the comparatively small number required annually to keep up the stock, it would not be economical to build and equip shops to carry out their own manufacture.

212. The erection of shops and equipping them with up-to-date machinery for the economic building of wagons would involve a very considerable outlay, and, unless the shops were constantly filled with work, a large capital would necessarily remain idle. This would more than outweigh any extra cost which might be incurred through the purchasing of trucks from outside sources, and we think improved purchasing arrangements, in anticipation of requirements, should be introduced.

213. It has been brought out in evidence that at certain periods of the year—especially during droughts—there is a shortage of sheep trucks. This requires careful attention and it is thought that consideration might with advantage be given to the designing of a combined truck to get over the difficulty. It is, however, desirable in developing a vehicle of this description that it should have the approval of the traders who are going to make use of it, and they should be consulted both during the design of the truck and its trial before putting any number of them in hand.

214. On some railways trucks with end doors are used, thus enabling cattle to be loaded at one end of a train and run through from truck to truck. The suitability of such a method for New South Wales might well be considered. Ordinary open goods wagons have on occasion been used, and, although causing certain suffering, have eased the position in the movement of starving stock.

215. The Chief Mechanical Engineer in his evidence (Q. 2929) gave a figure of £11. 8s. as the average maintenance cost per wagon in Great Britain. Here, again, he subsequently agreed that he had included items which were not at all comparable. The figure as now accepted is £7. 4s. In the Chief Mechanical Engineer's evidence (Q. 2930) reference is made to various comparisons between Great Britain and New South Wales, but it was later agreed that the figures were not accurate. It will be observed from the following comparison that the maintenance cost per wagon is higher in New South Wales than elsewhere in Australasia, with the exception of Victoria, and is higher than in Great Britain :—

Maintenance of Goods Wagons (excluding service vehicles) year 1923.

Company.	Cost of Maintenance.	No. of Goods Wagons.	Average cost per Wagon.	Revised on basis of English Costs.
	£		£	£
New South Wales	429,186	21,577	20	12*
Victoria	393,190	19,211	20	12†
Queensland	188,467	13,840	14	8†
South Australia	154,606	9,231	17	10†
Western Australia	85,773	9,670	9	5†
New Zealand	343,847	25,576	13	8†
Great Western	744,530	86,249	9	.....
London and North Eastern	2,914,029	281,748	10	.....
London Mid. and Scottish	1,921,979	302,550	6	.....
Southern	305,669	35,905	9	.....

\* This figure has been compiled on the basis of wages being 100 per cent. higher than in England and material 35 per cent.

† Reduced in the same ratio as in the case of New South Wales.

216. The wagon stock generally is in very good condition, and, in connection with the comparisons made, consideration should be given to the fact that the average carrying capacity of the New South Wales wagons is greater than on some of the railways quoted. It should also be borne in mind that all freight vehicles in New South Wales are fitted with automatic brakes. This does not apply generally in the case of the British railways, and would have an effect upon maintenance costs.

#### Automatic Couplings.

217. It was decided to adopt the automatic coupling in Australia with the expectation of being able to increase the loads and to deal with the coupling and uncoupling of trains in a more rapid manner than at present. It was also expected to reduce the total weight of the vehicle and the maintenance costs. This form of coupling had been decided upon in conference between the Commissioners of the various States, and the necessary alterations are being carried out as funds permit in each of the States. We have looked through the correspondence and have examined the coupler, and are satisfied that everything possible is being done having regard to the funds at the disposal of the Department.

### High Maintenance and Running Costs.

218. It will be noted from the foregoing remarks that the maintenance costs, failures, and coal consumption so far as locomotives are concerned are considered high. This is largely attributable to the fact that many of the engines are old and obsolete. They are, therefore, not up to their work and should have been renewed some years ago. It is not wise to keep locomotives in existence by indefinitely renewing their various parts. This was an old practice but experience has taught railway managers that it is undesirable and in every way uneconomical. The only way adequately to meet the necessary changes due to obsolescence and other causes is to wholly renew a certain number of locomotives annually or, on the basis of the expected life of the stock, allocate a sum every year to a reserve fund in order to meet renewals as and when it is convenient to carry them out.

219. Part II of the Report makes reference to the absence of any renewal fund to provide for obsolescence and wasting assets. After having given careful consideration to the utility life of rolling-stock, we have come to the conclusion that, on the New South Wales Government Railways, the renewal life of a locomotive should average thirty-five years, for coaching stock twenty-eight years, and for wagons twenty-five years. The capital cost of locomotives in 1923, was £6,937,260, carriages £3,514,054, and wagons £5,224,316. On the utility life bases mentioned above, and on the capital value of the stock in existence in 1923, this would mean the setting aside of £198,207 annually in respect of locomotives or the provision of thirty-eight engines; the setting aside of £125,502 in the case of coaching stock, or the provision of seventy-eight vehicles; and £208,973 in the case of goods stock, or the provision of 939 new wagons, making a total of £532,682. As we have emphasised elsewhere, nothing like a sufficient amount has been spent on renewals, and we understand this has been largely influenced, so far as locomotives and carriages are concerned, by the proposed electrification of the suburban lines which will release 157 engines and 300 carriages.

220. It is also absolutely essential that adequate workshops should be provided in order to deal with locomotive repairs at headquarters, as it is not economy to carry out repairs at small and outlying shops scattered over the line where various methods may be adopted, and where the constant supervision of those in responsibility at headquarters is impossible. It may be difficult and unnecessary to build new locomotive shops at once, and it would probably be wise, after moving the boiler shops and also the carriage shops to Chullora, to rearrange Eveleigh, and concentrate the repairs at that place, in the meantime purchasing new locomotives outside.

221. In the course of time the locomotive works should also be moved to the new site and laid out in such a way as to allow of all the repairing and building to be carried out there. Until this is done and the old stock replaced, little hope may be expected of any considerable reduction in the maintenance costs so as to be able to compare satisfactorily with an up-to-date and well-equipped railway. The number of engine failures on the New South Wales Railways should also be brought down to a normal basis with improved maintenance. Further reason for the abnormal quantity of failures which exists at present is the fact that there is an insufficiency of locomotives to deal with the work, as shown by the small number in reserve and the large proportion under repairs or waiting to go into the shops. An improvement in this respect will also have to be made before satisfactory results can be expected.

222. It is also noticeable that some of the engines with small wheels of 51 inches diameter are timed to run at too high a speed, and this, coupled with the rough roads that have to be traversed in certain sections, probably tends to break the springs and wear out the moving parts.

223. The excessive coal consumption is due no doubt to the difficulty in maintaining the engines, but, apart from this, arrangements should be made so as to enable those responsible to have definitely brought before them the classes of engines and also the depots which are the highest users of coal.

224. In concluding this Section we desire to emphasise the fact that out of the total working expenditure, the department supervised by the Chief Mechanical Engineer spends at least 50 per cent. On the New South Wales Railways in

in 1923, although nothing was spent for renewals, a sum of £5,247,980 is shown as the cost of the Chief Mechanical Engineer's Department out of a total expenditure of £10,649,974. This conclusively shows that special attention must at all times be paid to this Department, as it is vital, in the highest interests of the undertaking, that the Mechanical Engineering Branch should be governed in the most approved and economical way.

#### Proposed Standard Locomotives.

225. The number of different classes of locomotives is thirty-nine (Q. 2478), many of them being of obsolete types. It has, therefore, been essential to consider what types should be perpetuated so far as can be determined with a knowledge of the traffic, and the gradients and curves of the railways over which it has to be hauled. The conclusion we have arrived at, after going into the matter carefully with the Chief Mechanical Engineer, is that the engines which might be standardised as useful and of modern construction could be reduced to ten different classes. Eight classes now existing are enumerated as follows and are shown in diagrammatic form:—

	Class.	No.
Passenger.	S	145
	P	191
	N	5
	NN	35
	NN2	25
Total Passenger ...		401
Goods.	T	280
	TF	190
	K	150
Total Goods ...		620
Grand total ...		1,021

226. There are to-day 1,391 engines, of which thirty-four are not worth repairing and twenty are used by the engineer on construction work, thus leaving 1,337 for the purpose of working the traffic. This would mean that 316 would be left as old obsolete engines at present in traffic which would not be considered as standards. Of these, 157 will be thrown out of traffic when the electric scheme in connection with the new bridge is finished and the lines up to Hornsby, Parramatta, Bankstown and Sutherland are electrified, thus leaving 159 to be replaced, which should be done within the next four years. At the end of this time a standard class of engine will be adopted, and the costs of maintenance, &c., which are now high, should then be greatly reduced.

227. Amongst the ten standard classes will be two newly designed locomotives, one passenger and the other goods, which will deal with the heaviest class of traffic, and which appear to be in every way suitable. The designs of these have been examined and substantially approved by us. They will be powerful engines, and, so far as can be seen, should be able to deal satisfactorily with the heavier class of traffic carried over the New South Wales Railways. Diagrams of these are also shown.

#### Standard Carriages.

228. There are at present 107 types of coaching stock. These have been considered very carefully and, so far as passenger-carrying vehicles are concerned, it is our opinion that they might be reduced to eight different designs which are shown in diagrammatic form. Those selected as the future standard are of the latest types, but it will take many years to get these established, as the total passenger-carrying stock to-day is 1,760, made up of eighty-nine sleeping cars, 710 ordinary main line, and 961 suburban coaches. The number of those in the standard types is 210, leaving 1,550 to be replaced. A large number of these will be replaced with the new suburban electric service, but it will

will still leave many to be dealt with in course of time. From an economic standpoint, the aim should be to reduce the standards to as few as possible, and, when they can be brought down to our proposals, considerable saving should result, while the Traffic Department would be assisted materially.

#### **Electric Traction essential for dense Suburban Traffic.**

229. Electric traction has been carried out in many countries, and, from an operating point, with complete success in every case. It has not always, in the first instance, been adopted with the hope of immediate financial reward, but for the reason that on urban and suburban lines conditions have arisen with which steam traction cannot effectively cope. If the transport needs of the public are to be met in thickly populated areas, speedy and constant train services must be provided by those responsible.

230. The growth of suburban travel and requirements, especially at the rush hours, is so great that it can only be met by trains carrying a large number of passengers at frequent intervals. It, therefore, requires a means of transport giving quick acceleration and high speed, while, from the point of view of economical working, it is desirable that trains may readily be divided and run in smaller units at such times as the traffic requirements are relatively light. This necessity is met by substituting electric for steam traction, and it has usually been found that electric working leads to substantial economies in operation and other incidental advantages which in the end fully justify the capital outlay necessitated by the change. It may also be stated that, where heavy gradients exist, electric traction is most advantageous as the maximum power and even over load can be exerted without doing any harm to the machine. This cannot take place with the steam locomotive, as great care has to be exercised in order that the steam may not be allowed to drop.

#### **City and Suburban Railway.**

231. The New South Wales Railway system around Sydney lends itself in a most remarkable way to electrification, from its dense and congested traffic, its steep gradients, and the proximity of coal-fields. It has long been realised by the Railway Commissioners that the ever-increasing growth of the passenger requirements in and around Sydney must be met by improved railway and tramway services, and various Royal Commissions have been appointed to consider the matter and report thereon. It is understood this dates back as far as 1890, but nothing was finally submitted to Parliament until the end of 1915, when a part only of the scheme was sanctioned. This scheme, which was prepared by Mr. Bradfield, was for the City and Suburban railway to be electrically operated.

232. The work was commenced under an agreement with Messrs. Norton Griffiths & Co., in 1916, but, on the agreement terminating in May, 1917, work was resumed under the control of the Railway Commissioners. This continued only until July of that year when it was stopped by the direction of the Government. The work was again started in February, 1922, but with authority for only a part which is progressing at a very slow rate, and is only dealing with a section of the City railway barely sufficient to accommodate the traffic from one of the suburban systems. As only the eastern portion of the City railway has been authorised, great difficulty would have been experienced in crossing western traffic over eastern tracks, and, therefore, it has become necessary in the first place to electrify the most easterly lines, viz., the Illawarra, instead of those between Sydney and Strathfield, over which the traffic density is greatest.

233. A study of the map showing the original proposals instances clearly how valuable would have been the immediate electrification of :—

Main Suburban Lines to Parramatta.  
Strathfield to Hornsby.  
Hornsby to Milson's Point.  
Illawarra to Sutherland.

# N. S. W. GOVERNMENT RAILWAYS. DISPOSITION OF WORKSHOPS, CHULLORA.

WORKS UNDER CONSTRUCTION SHEWN

**234.** The plan of the lines proposed to be electrified and constructed shows that a very comprehensive view was taken of the whole situation so far as suburban traffic is concerned. The need for carrying this out at an early date is apparent, when it is pointed out that between 1910 and 1924 the increase in railway passengers has been 146·33 per cent., and in tramways 61·20 per cent., and, should the increase continue at the same rate, the passengers to be carried in 1930 will, it is estimated, number at least 183,000,000. Attention will be drawn to this more especially in the section of our Report dealing with "Operation," but it is mentioned here from the bearing it has upon rolling-stock, both engines and carriages. It is stated that there are to-day 157 locomotives employed in the transport of suburban passengers to and from the city, all of which would be released by the electrification of the inner group of suburban lines.

**235.** The number of railway cars in daily use in the suburban area totals 835, 80 being main line coaches which would be returned to main line work on completion of electrification. It is proposed to retire 250 of the older type of suburban cars, to construct 450 new cars and motor cars for the electric service and 145 new cars as trailers. With these and with 100 cars already built (which will ultimately become motor cars) 405 of the more modern existing cars will be used. This will give 1,100 cars, both motor and trailer (of which 345 will be additional vehicles to be charged to capital) for the suburban traffic, and with their greater seating accommodation it is hoped they will meet the increase which may be expected in the passenger service in the suburban area. It will be seen, however, that the only relief given to the replacement of old locomotive and carriage stock is 157 engines and 250 carriages—and this at the end of six years. It will, therefore, be necessary at the same time further to replace old and obsolete stock working on other portions of the railway.

**236.** Too much importance cannot be given to the necessity of pressing forward with the proposed City railway electrification, as it is absolutely essential that this should be completed by the time that the new bridge is built. As has already been pointed out, if the necessary accommodation is to be given to the increased suburban population from their homes to the city, the electrification, as shown on the plan, should be pushed forward at the earliest possible date. If this is not done, an increased number of locomotives would have to be built to deal with the suburban traffic, which afterwards would be of little use on the lines elsewhere.

**237.** Over and above the proposed electrification, we think it well to suggest that later on great advantages might be gained by carrying forward electric traction from Penrith to Lithgow, over the Blue Mountains, where there are very heavy gradients, and where there is an increasing demand for more frequent service, especially in the summer time. It is considered that the current ought to be generated cheaply owing to the adjacent coal, and that the gradients would enable the method of regeneration to be used with great economy.

**238.** It is also of interest to point out the mechanical disadvantages of the steam locomotive under the conditions prevailing in and around Sydney, which may briefly be summarised as follows:—

The locomotive being a complete independent unit, its power cannot be greater than the capacity of its boiler.

To increase the boiler capacity, obviously implies increased dimensions and weight, both of which offer grave difficulties in regard to clearances and strengthening of bridge structures.

It is known that on many railways the limit of weight has been reached, and further development of power is only possible at enormous expense.

The costly maintenance of boiler cylinders, valve gear, crank shaft, and all reciprocating parts.

The provision of turntables, water supplies, &c. That it radiates heat and uses coal all the time steam is up, i.e., during many hours when the engine is doing no work, either standing by or coasting.

**239.** The case for the electric locomotive may be set out by the brief statement that it is not hampered by any of the abovementioned objections. In addition, it possesses other important qualities, such as simplicity of mechanical construction and operation; increased acceleration and retardation; greater scheduled speed and consequently more frequent service, resulting in increased

use

use of existing track and rolling-stock; uniform turning effort and greater starting effort, facilities for driving from either end of locomotive, and also accessibility of mechanical parts.

240. It is common knowledge that to-day most of the countries utilise electric locomotives on their main lines. For instance, France has adopted the principle. America, Switzerland, Italy, and Norway have long used this method, and are still extending. It was recently stated in a railway publication that Sweden has the longest electrified railway in Europe at the present time. It may, therefore, be taken as an accepted fact that, where traffic is heavy and circumstances are suitable, traction with electric locomotives instead of steam is considered to be the most efficient way of working traffic. Having regard to the heavy grades to be negotiated, and to the availability of cheap coal for generating purposes, we consider that electric locomotives are eminently desirable over the district suggested.

IV.—MANAGEMENT.

(d) ELECTRICAL.

241. The Chief Electrical Engineer is responsible for the power supply and distribution on the tramways; lighting; the design of cars and equipments for the electric and steam tramway rolling stock; the repair and manufacture of parts for the repair of tramcars; the installation and maintenance of the telegraph and telephone systems; stationary electric motors and equipment; the purchase and maintenance of motor-cars, typewriters, clocks, watches, &c. He has under his control three main generating stations, situated at Ultimo (Sydney), White Bay (Sydney), and at Newcastle.

Ultimo Generating Station.

242. Dealing in the first place with Ultimo Generating Station, during the twelve months ended April, 1924, the total output was 67,653,864 kW. hrs. and the maximum hour-load 22,029 kW. The total normal capacity of the turbo-alternators is 36,500 kW., and the operating costs for the year ended April, 1924, were .5851d. per kW. hr. The Ultimo Power-house, which is the oldest of the three stations, operates at lower boiler pressure and is not fitted with economisers. Its plant consists of :—

Description.	No.	Normal Rating (each).	Heating Surface.	Normal Evaporation.
		kW.	sq. ft.	lbs.
6,600-volt 25-cycle Turbo-alternators	1	7,500	.....	.....
	4	5,000	.....	.....
2,200-volt 50-cycle Turbo-alternators	2	2,000	.....	.....
	2	2,500	.....	.....
Boilers ... ..	20	.....	3,140	10,000
	38	.....	2,852	8,000

The staff numbers 223.

White Bay Generating Station.

243. The total output from the White Bay Generating Station during the twelve months ended April, 1924, was 76,585,600 kW. hrs., and the maximum hour-load 18,088 kW. The following plant is installed :—

Description.	No.	Normal Rating (each).	Heating Surface.	Normal Evaporation.
		kW.	sq. ft.	lbs.
6,600-volt 25-cycle Turbo-alternators	3	7,000	.....	.....
Boilers ... ..	8	.....	8,280	27,000

244. The plant set out hereunder is at present on order for White Bay :—

Description.	No.	Rating (each).	Voltage.	Fre- quency.	Heating Surface.	Evaporation.
		kW.			sq. ft.	lbs.
Turbo-generators	2	18,750 (normal con- tinuous).	6,600	25	.....	.....
Turbo-generators	2	22,000 (maximum continuous).	11,000	50	.....	.....
Boilers ... ..	6	.....	.....	.....	11,979	100,000 (max.)
Boilers ... ..	8	.....	.....	.....	8,774	70,000 (max.)

245. The normal rating of the plant already installed is 21,000 kW., and that of the plant on order 81,500 kW., making a total normal rating of 102,500 kW. The operating costs were 4096d. per kW. hr. There is a staff of 120 employed in the White Bay Power-house.

#### Zara-street Generating Station (Newcastle).

246. The total output for the year ended April, 1924, was 27,233,808 kW. hrs., and the maximum hour-load 6,944 kW. The plant installed in the power-house is set out below :—

Description.	No.	Normal Rating (each).	Heating Surface.	Normal Evaporation.
		kW.	sq. ft.	lbs.
6,600-volt 25-cycle Turbo-alternators	1	7,500	.....	.....
	2	2,500	.....	.....
	1	1,500	.....	.....
11,000-volt 50-cycle Turbo-alternator	1	2,500	.....	.....
Frequency changer ... ..	1	2,000	.....	.....
Boilers ... ..	6	.....	8,280	27,000

247. There is in course of erection a generating plant with a normal rating of 7,500 kW., voltage 11,000, and frequency 50. The total normal rating of the installed generating plant is 16,500 kW., and when the plant in course of erection is in working order the figure will be 23,500 kW. The operating costs at Zara-street were 4564d. per kW. hr. The staff employed numbers 71.

#### Conversion of Current for Tramway Purposes, Sydney.

248. In the Sydney and Suburban area there are twenty-two sub-stations, with a total of fifty-five converters and a total normal rating of 40,350 kW., where 25-cycle 6,600-volt current supplied from Ultimo and White Bay is converted to 600-volt direct current for tramway purposes, &c. Three further sub-stations are either in course of erection or have been approved. In five of the sub-stations six batteries are installed, and there are also five battery houses. These batteries are used in connection with the supply to the tramway system, the total capacity being 6,600 ampere hours, at the one-hour rate.

#### Transformer Houses.

249. There are fifteen transformer houses for the purpose of transforming 25-cycle 6,600-volt and 50-cycle 11,000-volt current to lower secondary voltages for workshop and signalling services principally.

Sub-Stations,

### Sub-Stations, Newcastle District.

250. Two tramway sub-stations are in course of erection at Newcastle. These will be equipped with four rotary converters, the total normal capacity being 4,000 kW. 11,000-volt 50-cycle supply is obtained from Zara-street Power-house.

251. A sub-station with a capacity of 450 kW. and with 6,600-volt 25-cycle current from Zara-street is in service for supplying 600-volt direct current to the electric cranes, &c., used in connection with coal shipment.

### Railway Electrification.

252. In connection with the proposed railway electrification, provision has been made for the following sub-stations:—

Sub-station.					No. of Converters.	Total Normal Capacity.
						kWs.
Prince Alfred	...	...	...	...	3	13,500
Meek's-road	...	...	...	...	3	9,000
Hurstville	...	...	...	...	3	6,000
Sutherland	...	...	...	...	2	3,000
Waterfall	...	...	...	...	1	1,500
Total	...	...	...	...	12	33,000

These sub-stations will receive current for conversion to 1,500-volt direct current.

### Supply of Current in bulk.

253. Current is supplied in bulk from Ultimo and White Bay Power-houses to several municipalities and shires, including the Sydney City Council, and to the Parramatta Electric Supply Company. An agreement has been entered into for the supply of current in bulk to meet the future needs of the City Council, which will require an increasing supply each year, the estimate for 1930 being 70,000 kW. To meet this increasing demand, it is proposed to instal an additional 20,000 kW. turbo-alternator, provision having been made at White Bay to accommodate 60,000 kW. of plant over and above that previously mentioned.

254. Current is also supplied from Zara-street Power-house to a number of municipalities in the Newcastle District, including the City Council. The supply to the Municipality of Singleton involves a transmission line of approximately 51 miles long. Supply is obtained from the power-house through the Newcastle City Council for several of the large industrial undertakings in the Newcastle district.

255. During the twelve months ended April, 1924, the revenue received from the sale of electricity in bulk (including the Newcastle area) amounted to £133,604.

### New Power-house to meet increasing demands.

256. As it is anticipated that the power-house at White Bay will be fully loaded in 1930 to meet requirements for railway electrification and for bulk supplies, the provision of a new power-station (with a total effective capacity of 240,000 kW.) to be located on the South Coast near the coal-mines is under consideration. In our view, having regard to the increasing requirements of the City Council—which the Railway Commissioners are under obligation to meet, and to the proposed railway electrification—the provision of the new power-house is essential.

### Supply of Current to Public Bodies.

257. Current is supplied to several Government Departments, the principal being the Water and Sewerage Board (for the operation of low-level pumping stations), the Public Works Department (for the operation of bridge spans, &c.), the Department of Agriculture (for operating the terminal wheat elevator at Glebe Island), the Commonwealth Postal Department (for operating radio station at Pennant Hills), &c.

258. We are of opinion that the generating stations which we have seen are maintained in a thoroughly efficient condition. The oldest station is that at Ultimo, where there are no economisers, where there are a number of smaller units, and where there is a certain difficulty in connection with the circulating water. There is no question of extending Ultimo in the same way as at White Bay, but consideration should be given to the installation of larger units, larger boilers, and economisers.

#### Lighting Section.

259. New installations for electric lighting, stationary power requirements, radiators, &c., and the provision of low voltage services to meet the power requirements for railway signalling are undertaken from the electric light depot at Sydney, as also the maintenance of the existing installations and equipment set out below :—

Premises lighted Electrically.	No. of Installations.	Connected load in kW.	Source of Supply.
Railway stations ...	34	397	Departmental.
	74	151	Local (Council or private company).
Railway yards ...	12	263	Departmental.
	16	61	Local Council.
Loco. Depots ...	7	50	Departmental.
	14	90	Local Council.
Workshops .....	9	123	Departmental.
	6	167	Local Council.
Tramway ...	.....	726	Departmental.
	.....	12	Local Council.
Miscellaneous ...	.....	17	Departmental.
	.....	7	Local Council.

Total connected Lighting Load—2064 kW.

No.	Utilities.	Aggregating.
21	Lifts (7 passenger, 14 goods) ...	.....
350	Service transformers ...	1,810 kVa.
6	Isolated generating plants ...	100 kW.
156	Fans ...	16 kW.
359	Radiators ...	270 kW.
1,503	Miscellaneous electrical appliances ...	124 kW.

260. The train lighting depot at Sydney deals with the installation of equipments on rolling-stock for electric lighting as approval is received to proceed with the work. This work is performed at the Eveleigh Workshops in conjunction with the Chief Mechanical Engineer's staff. At the moment, the conversion of 648 main line cars from gas to electric lighting is in progress, and when this is completed the whole of the existing main line passenger stock will be lighted electrically. This depot also maintains electric lighting equipment on rolling-stock already in the service as set out below :—

No.	Class of Stock Equipped.
100	Main line cars.
150	Suburban cars.
31	Brake-vans.
10	Rail motor-cars.
120	Railway locomotives.
23	Tramway steam motors.
5	Breakdown cranes.

261. The lighting of steam rolling-stock is under the control of the Chief Electrical Engineer, but in the case of the new electrical stock this will be under the charge of the Chief Mechanical Engineer, the Chief Electrical Engineer being regarded as an electrical consultant.

Randwick

### Randwick Workshops.

262. The Randwick Tramway Workshops (Sydney) comprise a section of the Chief Electrical Engineer's Branch, and are supervised by a works manager who has under him a staff of 1,070. The following work is undertaken at Randwick :—

Manufacture of special fittings—electrical and mechanical—required for the installation of plant in the various electric power-stations.

Repair of fittings and manufacture of parts required in the overhaul of units from the electric power-stations.

Repair and manufacture of parts for the repair of 1,574 electric tram cars, 22 steam motors, 40 steam cars, and 91 motor-cars and lorries operating in the city and suburban area, and the manufacture of parts required for the repair of 36 electric tramcars, 70 steam motors, and 151 steam trailer cars operating in the Newcastle and Broken Hill areas.

Supply of light brass castings for the Carriage and Wagon Department, and solder to the Stores Branch, &c.

### Tool Shop.

263. The tool shop appeared to be adequately supplied with up-to-date machinery and tools, and it was observed that there was a very complete system of gauges in operation, thus rendering parts interchangeable and tending to economy.

### Pattern Shop.

264. The pattern shop deals with the manufacture and repair of all patterns for iron, steel, and non-ferrous metal castings used in the Chief Electrical Engineer's Branch. The stock of patterns is as follows :—

11,156 ordinary patterns for brass, iron and steel.

1,076 plate patterns for brass, iron and steel.

### Foundry.

265. In the foundry the work of manufacturing non-ferrous metal castings in standard alloys such as bronze, gunmetal, brass, copper, aluminium alloy, white metal, solder and plumbers' metal is undertaken. The Hawley furnace installed is used for melting scrap copper, &c., into the marketable form of ingots. Scrap brass is also reduced to ingots in this furnace, each melt being treated as a separate cast and numbered. Samples of each cast are analysed so that when used it can be brought back to standard alloys. The castings made are used for car manufacture and repairs, copper castings for electrical work, &c. The output is approximately 4.66 tons castings and 4.60 tons ingots per week.

### Smith's and Boiler Shop.

266. The smith's and boiler shop undertakes such work as the manufacture of under-frames for new cars and parts for the trucks of new cars; the manufacture and repair of parts for the repair and maintenance of all steam and electric tramway rolling-stock; the manufacture and repair of materials required for the repair and maintenance of the power-station and sub-station machinery; the development and manufacture of materials for the railway and tramway overhead lines—service and transmission; the manufacture of copper bonds and fishplates for the Engineer for Tramways, and the repair of stationary, locomotive, and steam roller boilers for the tramway services. The machinery and plant appear to be well suited for the requirements.

### Other Shops.

267. Other shops in the Randwick works are the welding shop, truck shop, car shop, paint shop, woodworking shop, machine shop, electrical fitting shop and the electrical repair shop. In each of these shops we are satisfied that the plant is of a reasonably up-to-date character and is adequate to meet the demands put upon it.

Workshops

### Workshops Committee.

268. A similar scheme to the Whitley Workshops Committee is in operation at the Randwick Shops. As a result of meetings of this committee certain small adjustments have been made, and it is considered that the arrangement tends to harmonious relations between the management and the staff.

### Cadets and Apprentices.

269. A cadet system is in operation for the purpose of training officers for the Chief Electrical Engineer's Branch. We are of the opinion that this serves a useful purpose and might with advantage be extended to other branches; for instance, that of the Chief Mechanical Engineer. Educational attainments and personality are taken into consideration when selections are made, and there is also an examination to be passed.

270. Apprentices are selected by a Staff Board, and a roster is provided for each trade, which it is considered allows of a complete training. Technical instruction is given by the Railway and Tramway Institute and the Technical College.

### Bonus System.

271. The bonus system of payment was first introduced at the workshops in 1905 for armature winding only, and was applied generally in 1919. There are 3,906 bonus items in operation, and over 60 per cent. of the staff are now working under the bonus arrangement. As an incentive to additional effort, the system provides for an extra percentage payment over the rates of pay fixed by the Industrial Court Awards.

### Newcastle Shops and Shed.

272. The Gordon Avenue Workshops and car shed and the Parnell-place running shed at Newcastle form a section of the Chief Electrical Engineer's Branch. There are at the present time in Newcastle and Maitland 36 electric cars, 59 steam motors, 103 steam trailer cars, and 14 miscellaneous vehicles. The electric cars are operated from the car shed, the repairs being carried out in the works, except ordinary running repairs, which are dealt with in the shed. The cars are all of one type and are fitted with the same equipment. All repair parts are manufactured at Randwick and are requisitioned as required. As the electric service in Newcastle has only been in operation since December, 1923, no heavy repairs have yet become necessary. At the present time the works are mainly engaged on the overhaul and running repairs of steam motors and cars in the service, the heavy repairs being carried out at Honeysuckle Point.

273. The depot at Parnell-place is a steam motor and car running shed only, and will be displaced when the electric service is in full operation.

### Tramway Comparisons.

274. It is interesting to compare the tramways in New South Wales with those in Great Britain, particularly in respect of maintenance costs. These are as follows:—

Item.	New South Wales.		London County Council.	Manchester Corpora- tion.	Sheffield Corpora- tion.	Glasgow Corpora- tion.
	Actual.	Revised Basis.*				
Cost of car repairs.....	£411,925	£250,887	£557,532	£152,554	£81,587	£101,814
Cost of car repairs per car-mile .....	3.42d.	2.08d.	2.11d.	1.80d.	1.97d.	.91d.
Cost of car repairs per car in stock ..	£307	£187	£277	£183	£214	£105
Number of units used per car-mile...	3.06	...	2.13	1.75	2.33	1.59
Schedule speed (miles per hour) ...	8.85	...	9.29	7.5	...	7.46
Average miles of motor-cars per day	66.5	...	121.49	84	...	97
Average motors per car .....	2.92	...	2	2	2	2

\* This figure has been reduced on the basis of wages being 100 per cent. higher than in England and material 35 per cent.

275. One of the principal differences between New South Wales trams and those elsewhere is the large number of stops required and the very speedy acceleration demanded necessitating an excessive use of current and consequent powerful motors.

276. The weight of cars would affect the comparison, but, as we have no accurate figures of weight before us, it is considered wise to omit them. The electrically operated air-brake also accounts for some extra energy consumption, and, no doubt, has a bearing upon the increased number of units used per car-mile.

277. The more severe operating conditions resulting from the much more frequent starting and stopping of the Sydney cars, have a very material effect upon the wear and tear and cost of upkeep of the whole equipment of the rolling-stock. Much more work is thereby thrown upon the motors, the control equipment, the brake mechanism, and the brake shoes and tyres. It is considered to have been established that it is impossible to meet the traffic demands of the public of Sydney without a car of large seating capacity, maximum means of ingress and egress, and means of coupling in pairs. As the high acceleration and the heavy grades upon which these cars must be operated involve all driving wheels, the result is four motors per car, and eight motors per pair of coupled cars, calling for complicated multiple unit control. The latter involves very much extra cost for inspection and upkeep. The coupling of cars also necessitates the use of air-brakes, with their attendant consumption of power and additional cost of maintenance for motors, compressors, and control.

278. Taking everything into consideration, the comparisons are considered favourable to the New South Wales trams.

279. At the present time there are fourteen classes of cars in service, but it is the intention to build only three of these types for the future, and these which are reproduced in diagrammatic form are as follows:—

Type.	Seats.	Truck.	Cars.	Weight in tons.	No. in Service.
P	80	Bogie .....	Cross-seat .....	16.30	192
LP	70	M.T. ....	„ .....	14.87	46
J	50	4 W.H. ....	„ .....	11.40	47

280. The “P” type car has a carrying capacity of eighty passengers, in cross seats, equal wheel bogie trucks, each axle carrying a motor of 40 h.p., and multiple unit control. These characteristics are necessary in order to meet the severe service, including high acceleration and heavy grades, of Sydney.

281. The “LP” type car has a carrying capacity of seventy passengers, in cross seats, and is provided with maximum traction trucks, each carrying one 55 h.p. motor. This equipment, with platform control, meets the requirements of Newcastle, where the grades are uniformly lighter than those of Sydney, and the service much less severe.

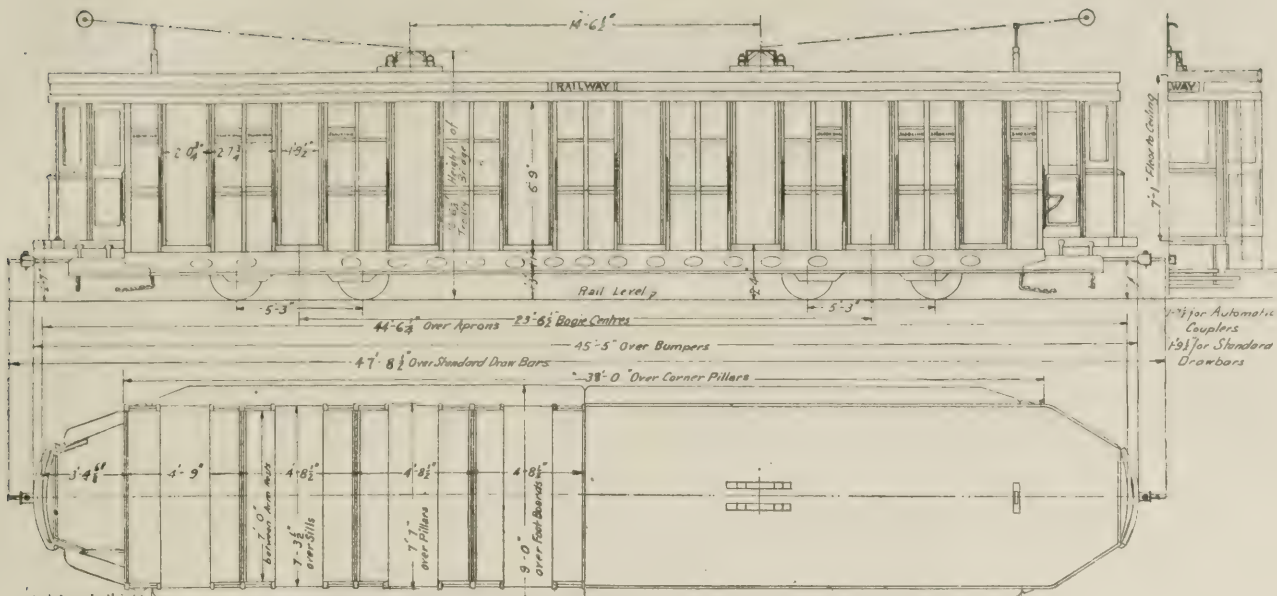

282. The “J” type car will be used on the very heaviest grades, where the conditions present very special risks, and track brakes are considered necessary. These cars have a carrying capacity of fifty passengers, and will be fitted with a 50 h.p. motor on each of the two axles.

#### Renewals.

283. So far as the machinery in the power-houses and sub-stations is concerned, it will be seen from the following statement that in our calculations we have regarded the utility life basis as being eighteen years, and in the case of tramcars as twenty-five years. It is not, however, clear when the high-power electric machines will become obsolete, and in such circumstances—beyond emphasising the need of a renewals fund, as in the case of the permanent-w

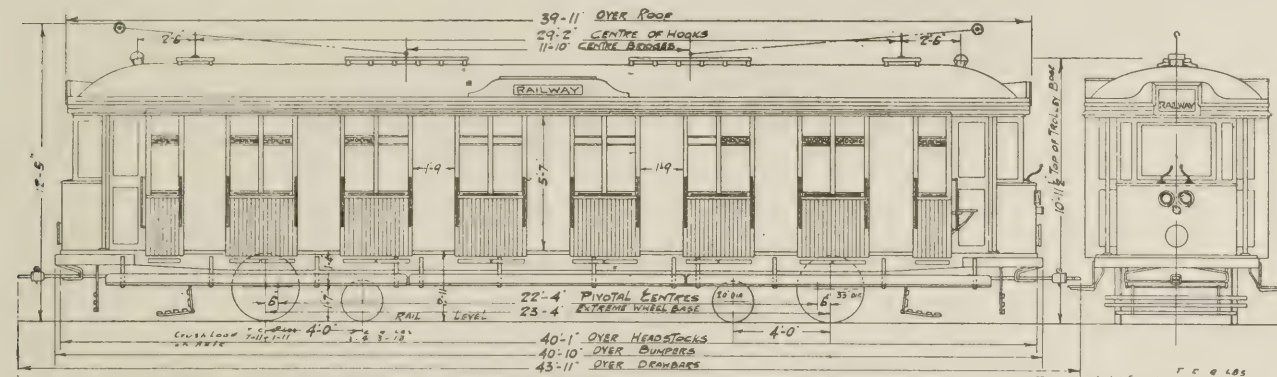

an

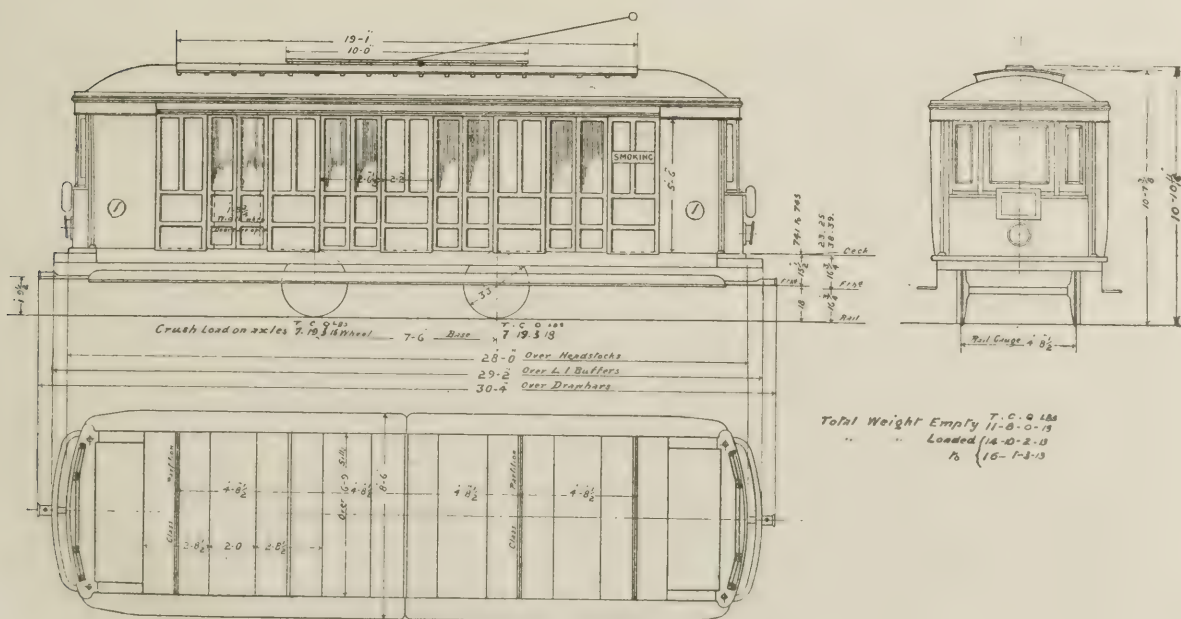

Variations in Height  
 wheel wear (27 to 34) 1/8  
 Bearing (Boiler) rule 1/4  
 Spring deflection  
 crush load (propagator) +25% 1/16

Standard Types of Tramears.

and rolling-stock—it is not possible at present to fix a definite life basis. The statement, therefore, is reproduced principally to show the practice which has ruled in the last few years in respect of the renewal of machinery and tramcars.

#### Machinery at Randwick.

Twelve months ended 30th June.	Capital Value.	Value of Renewals on 18 years' life basis.	Amount actually spent on Renewal of old Machinery.

1923	1,588,370	88,243	44,896
1924	1,698,034	94,335	61,290

#### Electric Tramcars.

Twelve months ended 30th June.	Capital Value.	Value of Renewals on 25 years' life basis.	Amount actually spent on Renewal of Rolling-stock.
	£	£	£
1920	1,644,637	65,785	.....
1921	1,699,835	67,993	30,000
1922	1,764,240	70,570	.....
1923	1,899,852	75,994	30,000
1924	2,230,929	89,237	15,000

#### Car Sheds.

284. Car sheds are situated at Rozelle, Wavefley, Ultimo, Newtown, Tempe, Dowling-street, Military-road, Fort Macquarie, Rushcutters' Bay, Manly, Enfield, and Rockdale. The work carried out in the sheds consists mainly of brake adjustments, examination and replacement of faulty equipment, examination of wheel flanges, rectification of loose bolts or broken frames, and the cleaning of cars.

#### Mains Sections.

285. The main depot, which is at Leichhardt (Sydney), deals with pole erection, installation of feeders and cables, overhead trolley wires and network, telephone cables and wiring—Metropolitan and Newcastle areas—and the testing and repairs of electric welding plant, electric grinding plant and rail bond. There are twelve maintenance depots consisting of buildings for housing vehicles, horses, and stores, and fifteen pole storage yards used for stacking poles at convenient locations throughout the Metropolitan area, being adjacent to railway or tramway sidings. There exist at the present time 199 miles of high-tension underground cable, 204 miles of high-tension overhead transmission lines, 66 miles of low-tension underground cables, 1,320 miles of low-tension overhead feeders, and 345 miles of

of trolley wires and supporting wires (tramways), while over 100 miles of feeders and transmission lines are under construction. This section is also responsible for the installation and maintenance of the telegraph and telephone system, as follows :—

Telephone cables, lead-covered, and telephone wires—

Laid underground and in boxing on concrete pegs	...	110 miles.
Pot-heads and testing points	... ..	139
Telephone wires	... ..	412 miles.

**Engineer of Tests Section.**

286. An Engineer of Tests is attached to the Chief Electrical Engineer. He deals with the standardisation and maintenance of all portable and sub-standard electrical testing instruments and meters, the supervision of the repair and calibration after repair of all portable and switchboard instruments and meters, the inspection and testing of electrical materials used throughout the service, the performance of acceptance lists on electrical machinery and apparatus, &c.

**Telegraph Maintenance.**

287. The Chief Electrical Engineer is responsible for the installation and maintenance of telegraph instruments, telephone and telephonette instruments, Morse batteries, electric clocks, electric intercommunication on trains, burglar and fire alarm circuits, electric bell circuits, magneto telephone switchboards, automatic telephone exchanges, and selector telephone systems. These are installed throughout the railway and tramway systems, divided into city and country areas, and are maintained by a staff of mechanics, &c., under the supervision of an inspector.

**Clocks and Watches.**

288. The Chief Electrical Engineer is responsible for the purchase and maintenance of all clocks (except those electrically operated), watches, time-recorders, and watchmen's tell-tales. The number in service at the present time is as under :—

Clocks	...	...	...	...	2,106
Watches	...	...	...	...	4,816
Bundy and autograph recorders	...	...	...	...	66
Tell-tales	...	...	...	...	37

The actual repairs to time-pieces, &c., are carried out by a contractor under the supervision of this Branch.

289. In our view the purchase and maintenance of clocks, watches, &c., is more closely allied to the Comptroller of Stores Branch than to that of the Chief Electrical Engineer.

**Typewriters.**

290. The Chief Electrical Engineer is also responsible for the maintenance of typewriters, the actual work of repair being undertaken by a contractor. A stock of machines is available to take the place of those under repair. We are of the opinion that this section might be transferred to the Comptroller of Stores.

**General.**

291. We are satisfied with the general equipment of the shops and with the work turned out. The Branch appears to be very well staffed—in fact, a criticism might be levelled that the technical staff is somewhat too elaborate. This staff consists of the Chief Electrical Engineer, the Chief Assistant Electrical Engineer, the Works Manager, the Power Superintendent, the Supervising Engineer, the Chief Telegraph Inspector, the Engineer of Tests, the Rolling-stock Superintendent, the Engineer, the Chief Inspector of Boilers, the Mains Superintendent, the Substation Superintendent, the Lighting Superintendent, the Assistant Engineer, and the District Electrical Superintendent (Newcastle).

## IV.—MANAGEMENT.

## (e) STORES.

292. The Stores Branch is in the charge of a Comptroller of Stores, who is responsible to the Commissioners for the purchase, conservation, and distribution of all stores for railway and tramway purposes, including the disposal of coal from the State Colliery, but excepting perishables, &c., required by the General Manager of the Refreshment Rooms.

293. The headquarters of the Branch are at Eveleigh, and at the date of the inquiry the authorised staff numbered 403. This number includes a chief stores assistant, 8 inspectors, 153 clerks, 126 storemen and boys, and 103 labourers, together with 11 motor lorry drivers, gangers, &c. The Branch is divided into five main sections, Purchasing, Receiving and Issuing, Accounts, Records, and Correspondence.

294. The major portion of the material required for general use is received and issued at the main store depot at Eveleigh, while branch stores are situated at all railway and tramway workshops and depots throughout the system.

**Means of Obtaining Stores.**

295. Stores are obtained either on manufacturing orders from departmental workshops, from local manufacturers, usually through a merchant or broker, or, in the case of overseas supplies, through the Agent-General in London, or the local agents of foreign firms in Australia.

296. Annual tenders are let for the period of the financial year in connection with those items in general use; while other stores having a slower out-turn are purchased as required. The quotations are usually sent into the Stores Branch, the Commissioners' authority being obtained before the acceptance of tenders, but in the case of special plant or technical materials, the head of the Branch concerned obtains quotations and makes recommendations to the Commissioners. In this case, however, the Stores Branch follows the matter to completion in connection with delivery arrangements, &c.

297. Direct delivery to the various branch stores or works is arranged in the case of heavy bulky articles in order to prevent unnecessary handling and to secure certificates for machinery, plant, &c. Issues from the main store are made for locomotive depot trust stores once monthly, while traffic station stores are forwarded every two months by stores railway vans, and stationery is issued quarterly.

298. The method adopted for dealing with materials manufactured departmentally is as follows:—The Chief Accountant sets up a division of the Stores Advance Account designated a Manufacturing Account, and this operates between the Chief Accountant and the head of each manufacturing branch. The Chief Accountant debits the branch concerned with the cost of the materials used and the wages expended in connection with the manufacture of the various articles. The Stores Department takes over the manufactured articles through the Stores Advance Account at the end of each month, and gives credit to the particular manufacturing branch for the value of the articles. The general principle adopted in connection with the charge to be made to the Department is for the whole cost to be debited to the Stores Advance Account, and from that an average cost per pound or per hundredweight is calculated for retail charging to the branch supplied. In addition to manufacturing for direct stores order, the branches also make some of their own requirements without such an order, but the adjustment of charges is made through the Stores Advance Account.

**Issue of Stores.**

299. Stores are issued from the main stores under the control of the Stores Branch upon receipt of requisitions signed by officers who have been authorised in that regard. At branch and workshop stores authorised by the Stores Branch, a requisition from an authorised officer, or an issue docket signed by the foreman

or

or sub-foreman, as the local circumstances necessitate, is insisted upon. At the Trust Stores, *i.e.*, those under the head of the branch concerned, a docket from the officer-in-charge or an authorised foreman, sub-foreman, or officer of other designation is required before the storeman will issue the goods.

300. Oils for enginemen are supplied from the Loco. Trust Stores as required, and the total quantity taken out is noted on the running sheet for the trip, as well as a record being kept in a special book in the Running Shed Store Office. The difference between the actual quantity at the commencement of a run and that returned on its conclusion, after making allowance for receipt at foreign depots, is treated as actual issue. The question of coal issue and accounting is discussed in Part IV (c).

301. Detailed records of issues from the Trust Stores are not kept by the Stores Branch, but by the particular branch accountants concerned. The Comptroller, however, keeps in touch with the whole business through the monthly committees.

#### Trust Stock.

302. The value of stores is debited to the Stores Advance Account until the stores are issued. About half of the stock debited thereto is held under the direct control of the Comptroller of Stores in main and branch stores, and in some workshops. The balance is held in Trust Stores by the various branches under the control of the head of the branch concerned, through his local officer-in-charge, *e.g.*, Divisional Engineer, Steamshed Inspector, and so on. The value, however, is still debited to the Stores Advance Account until issued. Details of the items on hand, with their value, are kept by the head of the branch holding the stock, and the total only kept in the books of the Stores Branch. A summary is sent the Comptroller of Stores monthly showing the total amount issued from the Trust Stock.

303. Coal is despatched direct from the collieries to the point where it is to be used, and is under the control of the using officer. Excepting coal for locomotive and power-house use, the cost is charged to the receiving branch immediately. Only the quantity consumed by the Locomotive and Power Branches is debited, the figures being verified by a check stocktaking. The stock of such coal, although held by other branches, is recorded on the Stores Books, together with the value, and is cleared by the monthly requisitions for the coal used in that period.

#### Charging out of Stores.

304. The general practice is that stores are not charged out until issued for use. In some cases the value of materials obtained for capital works, *viz.*, rolling-stock construction, is debited to the vote for such works, although the material is usually retained by the Stores Branch until actually wanted. A Suspense Account is opened in the ledger to which the amount charged in advance is credited, and this account is debited, and the account for the item credited, as the materials are issued on account of the work. The amount so charged in advance is generally less than 5 per cent. of the total value of the stores held.

305. Stores are charged out at actual prices in the majority of items, although at Trust Depots average prices are taken for small issues of such items as bolts and screws. There are a few exceptions, such as engine coal, which is obtained in about four different localities, and sent throughout the system. An average price is charged based on the total purchases, taken in conjunction with the quantity and value of starting stock, except at Lismore, where the actual cost, plus shipping charges from Newcastle to port of unloading, is charged. In the near future, however, Lismore coal will be despatched by rail, *via* ferry at South Grafton, and the average price system will be extended to that depot.

306. New iron, brass, and steel castings (rough) manufactured in the foundry at Eveleigh Workshops are also issued at an average price. The Store Advance Account is debited with three totals for these castings, and the average is based on the output of each class. There are a few other items in which averages are taken.

307. It is not the practice to re-value all the stock on hand. With items obtained under annual contracts, however, the stock on hand at the end of one year is re-valued at the next year's rate, but the amount involved would not be great. As stock is reported as obsolete, the value (less any scrap allowance) is written off against the branch for which it was obtained, or, if for general purposes, against Stores Working Expenses, which are spread over the cost of the principal branches. Surpluses at stocktaking are generally used to write down the book value of slow-moving items.

Stocktaking and Inspection.

308. Stocktaking is carried out by inspectors under the Comptroller of Stores, five inspectors being engaged on this work. As a general rule, stocktaking is done once a year, although there are exceptions, viz., seasoning timber at the Main Store, Eveleigh, where the check is made every two years. Besides stock-taking, the inspectors also ascertain whether surplus stocks are being held, after comparison of the stocks with the average issues, and in consultation with the local officer arrange for the return, usually to the Main Store, of quantities not required at the particular depot.

309. As regards the quantity of stock on hand, the endeavour of the Department is to maintain equal to approximately one month's estimated consumption; having regard to the ease and speed with which an item can be obtained, and whether it is cheaper to purchase large quantities at a lower rate or smaller quantities as required at a higher rate.

310. As regards coal, a reserve stock sufficient for two months is considered adequate.

311. The following statement shows the stores purchased, issued, and on hand for the years 1913-24 inclusive, and indicates that a marked improvement has been effected in the proportionate quantity of stores on hand to yearly issues. While price factors cover this to some extent, the figures represent a satisfactory development.

312. A comparison of the turnover of stock for the years 1912-13 to 1923-24, as given below, also indicates the existence of an effective form of control. While the turnover of coal has declined, due to the building up of a larger (and necessary) coal reserve, the turnover of general stores has improved very considerably.

STATEMENT of Purchases, Issues, and Ending Stock for Years 1913-24 inclusive.

Year ended 30th June.	Purchases.			Issues.			Ending Stock.		
	Other than Coal.	Coal.	Total.	Other than Coal.	Coal.	Total.	Other than Coal.	Coal.	Total.

1924	5,019,348	1,249,014	6,268,362	5,162,283	1,227,108	6,389,391	1,411,376	187,156	1,598,532

During 1917-18 period £204,292 value of coal was purchased as the nucleus of a reserve stock of 300,000 tons of large coal.

The debit was accepted by the Government, through the Public Works Department, and the value is also included in the issues for the same period. During 1922-23 and 1923-24 large coal to the value of £33,422 and £22,195 was similarly dealt with.

Of the £187,156 value of coal on hand as at 30th June, 1924, £32,050 represents the value of the reserve of small coal held at Rozelle for power-house requirements.

The figures given include Railway, Stationery, and Tramway transactions; those for 1923-24 are approximate.

The ending stock of one period is the starting stock for the succeeding period, and has only been shown once.

On and after 1st May, 1919, Railway revenue was credited with freight, at the rate applicable to private consignments, on coal conveyed by rail for the Tramway Department, and the value thereof was added to the purchase cost, and issue rate increased accordingly. The additional amounts included in value of coal purchased for the years ended 30th June were :—

	£					£

\* As the issues of coal in 1917-18 included £204,292 on account of debit for reserve stock of coal accepted by Public Works Department, turnover of coal has been calculated on an issue of £613,841, and on the total issues of £2,835,897.

### Elimination of Item in Capital Account for Stores.

313. There is a financial matter connected with stores which it would be well to put upon a better footing. Stores bear 5 per cent. interest upon about £1,500,000, representing an advance made by the Treasury for purchases. This amount should be eliminated from Capital under the rearranged scheme of finance which we recommend.

314. The Stores Branch is at present undergoing a measure or reorganisation on lines designed to give the Comptroller direct supervision over all stores. This will abolish the trust stock system, which obviously has certain defects in that a large proportion of unallocated stores is not under the direct supervision of the Comptroller. We recommend that this change should be effected as speedily as possible, as we are of opinion that the staff attending stores conservation and issue at all places should be under the direct supervision of the Comptroller. In this connection it is noted, from observations made at various Board meetings that there has been a certain laxity of supervision that would have been obviated if the Comptroller had been directly responsible for the stock all over the system.

315. We are quite satisfied with the manner in which the items held in the main and subsidiary stores are classified and stocked, and also with the "Card" system of recording issues and receipts. The stores were found to be clean and generally adequate for the work.

316. The Comptroller is very much alive to his responsibilities, and judging from the all-round improvement in the administration of the Branch since he assumed office, we are of opinion that, following the abolition of the trust stock system, the Commissioners may have confidence that the stores under their charge are being economically and effectively controlled.

## IV.--MANAGEMENT.

### (f) OPERATION.

317. In any criticism of traffic movement, whether of passenger or freight, as at present existing upon the railways of New South Wales, two outstanding factors—one permanent, the other, it is to be hoped, temporary—must be borne in mind. The exceptional number of steep grades and sharp curves upon each of the main routes adversely affect speed and cost, while the shortage of rolling stock in certain directions curtail at one and the same time train services and public facilities.

### Supervision of Working.

318. The supervision of operation is under a Chief Traffic Manager, stationed at Sydney. This officer is assisted at headquarters by a Chief Assistant Traffic Manager, three Outdoor Assistants, and three officers designated respectively Superintendent of Passenger Transportation, Superintendent of Goods and Livestock Transportation, and Goods Superintendent. For purposes of local

local control the system is divided into nine districts, each in charge of a District Superintendent, aided by an Assistant and a number of Inspectors. The district headquarters are at Sydney, Goulburn, Junee, Eskbank, Orange, Parkes, Newcastle, Murrurundi, and Lismore.

319. The Chief Assistant Traffic Manager controls the Staff, Coaching, Season Ticket, New Works, Claims and Investigation Sections, and also supervises the work of the Country Ticket Examiners. The Superintendent of Passenger Transportation compiles and issues timetables of all classes, is responsible for the weekly special notices, controls the composition, marshalling and car allocation for all passenger trains, supervises the movements of carriages and sleeping cars, and generally has charge of all work associated with the transport of passengers. The Superintendent of Goods and Livestock Transportation supervises the freight train service generally, this including the control of goods engines, the adjustment of engine load tables (in conjunction with the Chief Mechanical Engineer), and the control of goods and livestock wagons throughout the system. He also regulates the supplies of locomotive coal, supervises the work of the tarpaulin factory, and acts as Chairman of the Assistant District Superintendents' Conference held monthly. The Goods Superintendent's responsibilities embrace the control of the goods business throughout the State in connection with the loading of vehicles, undue delay to goods traffic, average loads, rates and freight charges and conditions, and a general oversight of all matters pertaining to goods transactions.

#### Duties of District Superintendents.

320. We have dealt with head office organisation in Part III under a proposed scheme of decentralisation, but the detailed duties of the District Superintendents demand consideration. They are, to some extent, responsible for the work of their districts, so far as the Traffic Branch is concerned, on both the operating and commercial sides. Theoretically they control all train working, supervision of traffic staff, the handling of rolling-stock, and the working of the stations. Their assistants are mainly engaged in the supervision of train running throughout the district and in exercising control over the Inspectors. The latter officials directly supervise the working of all stations in their allotted areas and make half-yearly inspections of each station. They also investigate public complaints, as they may be directed by the District Superintendent. As a matter of fact, the District Superintendents do not supervise train working excepting during daylight hours. At night, station-masters may and do order out engines and advise the running of trains without the knowledge of the District Superintendents. Records show that delays are not infrequently caused by special train advices being improperly timed as the result of inexperience or want of knowledge as to the actual conditions on the line. The trains should be controlled by District Superintendents as to the stations at which trains are to cross on single lines, and generally as to train movements through the district. We consider it desirable that a system of control should be set up in each District Superintendent's office, open day and night, and instructions issued from that source alone.

#### Extension of Train Control Recommended.

321. It may be added that centralised train control is now in operation in two areas, on the Illawarra Line and in the Sydney Metropolitan Suburban area, the latter being the first part of a much larger scheme which will ultimately embrace a considerable mileage of line. The Sydney scheme has not been in operation for a sufficient length of time for any figures of operating economy to be compiled, but we are informed that the installation on the Heathcote-Kiama section, 52 miles in length, has resulted in a definite saving of £11,757 per annum, in comparison with results in non-control days. The Control Office for this section is located at Thirroul, and the system adopted is a simple one which we commend. The essence of successful control working is simplicity, and for that reason we deprecate the provision of elaborate appliances. In view of the operating economy admittedly effected as the result of the installation of control working on the Illawarra Line some years ago, it is advisable to extend the system on a wider

wider basis as speedily as possible. Obviously, increased telephonic facilities will be requisite, but the scope for economy is so great that the cost of such additional telephones should be faced immediately.

#### General Instructions should be Revised.

322. General instructions to the operating staff appear to be on the elaborate side. The Superintendent of Passenger Transportation admitted in evidence (Q. 2110) that it was not possible for an employee to keep them in his head. They might with advantage be simplified during the process of decentralisation. On many railway systems considerable economies have resulted from a general overhaul of office work by a committee representative of the various branches. Duplication of returns and forms that have outlived their utility have often by this means been cancelled, and the paper aspect of railway business reduced to a minimum. It would be advisable to keep an eye upon this also with decentralisation.

#### Statistics of Traffic Districts.

323. The staff in the Traffic Branch numbers over 10,000 in all. The Chief Traffic Manager's headquarters staff numbers 418, this including the principal departmental officers, while the remainder of the personnel is distributed over the system as shown below. Particulars of line mileage, number of stations, unattended sidings and traffic volume are also given for each district for general reference purposes.

District.	Mileage approx.	No. of Staff.	No of Stations.	Unattended Platforms.	Traffic Density. Tons per mile per day. April, 1924.
Sydney ... ..	272	3,723	159	109	46,808
Goulburn ... ..	652	721	90	50	27,178
Junee ... ..	814	658	72	89	18,532
Eskbank ... ..	604	748	69	65	21,117
Orange ... ..	687	449	51	66	7,712
Parkes ... ..	794	218	42	76	4,341
Newcastle ... ..	113	1,480	62	24	52,637
Murrurundi ... ..	929	766	99	68	13,686
Lismore ... ..	579	292	46	90	5,858

#### Passenger Train Services.

324. The general scheme of passenger train services provides first for the fixing of Mail and Interstate train times, and the building up of other train services round them. Suburban trains are an exception, these being governed by the density of passenger movement into and out of the cities.

325. In order to meet Post Office requirements, Mail trains leave Sydney in the evening, and in the reverse direction, departures from the termini are fixed to enable the trains to arrive in Sydney in the early morning. Interstate trains between New South Wales and Victoria and Queensland are also night trains on the New South Wales system. Sleeping accommodation is, therefore, a necessity on each of these trains, and very special consideration should be given to it in the interests of comfortable travel. Under any type of equipment in respect of sleeping and lavatory compartments, a night journey is bound to be tedious, especially so to women and children in hot weather, and the more complete and comfortable the night trains are the greater may the traffic be expected to grow.

326. On the South African State Railways, where night travel and transport conditions generally have many points in common with New South Wales, special attention is given to up-country travel. It is claimed that there the carriages are among the best extant. A modern first-class main line saloon coach provides seating accommodation for thirty-nine passengers and sleeping berths for twenty-six, and other stock is in proportion. No extra charge is made for sleeping accommodation. Dining cars are attached to all except short distance trains.

327. Sooner or later public opinion will force recognition of the claims by second-class passengers for sleeping berths on the New South Wales railways similar to the accommodation given elsewhere. At present it cannot be done; it is to be hoped, however, that with augmented rolling-stock provided by the expenditure foreshadowed in the Commissioners' estimate of future Capital commitments, this very desirable improvement in night travel will be accomplished.

#### Interstate Trains.

328. On Interstate trains, which, from a revenue point of view, are very valuable, carriages constructed upon the side of what may be termed luxury may be expected to pay handsomely. To make these trains equal to the best in other countries would require much better rolling-stock than is at present provided, and an improvement by the provision of breakfast, luncheon or dining cars would be desirable, not only as a convenience but in order to effect a saving in transit time by the reduction of stops at refreshment-room stations. Nothing better can be done than is being done with the rolling-stock available, but, as new carriages are built, we suggest that a superior type should be introduced on the Mail and Interstate trains, the receipts from which show that cultivation of this traffic is likely to pay well and give satisfaction to the public. It may be that additional trains will be necessary to carry out these suggestions, but the traffic can well bear the expenditure thus involved. As remedying an inconvenience felt by passengers in Mail trains reaching Sydney at an early hour of the morning, it would be well, if possible, during the remodelling of sidings at the Central Station, to make room for trains to stand in order that passengers may remain undisturbed in their sleeping berths until a reasonable hour. This is a practice adopted at many places abroad where trains arrive very early in the morning.

#### Sleeping Berths.

329. Inconvenience due to delay in allotting berths, to berths being given to others after allotment, and uncertainty as to whether berths had or had not been provided, formed the subject of many complaints. There would certainly appear to be grounds for these complaints, and they point to necessity for the overhaul of instructions as well as the carrying out of them by the staff.

#### Mail and Interstate Trains.

330. The speed of Mail trains, governed as to stops by the Post Office, is about 30 miles per hour, and cannot well be improved, having regard to gradients, curves and refreshment time. Interstate trains run at 36 miles per hour, including stops, and these also cannot be expedited to any appreciable extent for the same reasons. The exceptionally heavy grades are noted in the permanent-way section, but it may here be mentioned that there are 162 miles of a grade at 1 in 40 or less, and 1,654 miles of 1 in 100 or less out of a total of 5,523 route miles of line.

331. According to the records, the timekeeping of the Interstate trains has not been good. In one month the Sydney-Melbourne Limited was seriously late on fourteen occasions on arrival at Albury, and nineteen times late on reaching Sydney. Locomotive failures were mainly responsible for these delays (see Part IV, Section (c)). Delays from a similar cause have occurred to trains on the Northern section. Unpunctual running of these important trains reacts on other trains and upsets the services over a wide area. Delays of this character to Mail trains have not been so numerous, but there have been very late arrivals occasionally.

#### Train Services on Country Branches.

332. The trains run on the country branches give a very poor service. It is said that the population and consequent traffic do not warrant more trains. In this connection, however, it may be observed that in Great Britain and other countries a similar argument could be advanced in respect of many branch lines which do not pay *per se*; nevertheless, numerous trains are run, the policy and accepted obligation being the provision of a reasonable train service to enable inhabitants to travel to and from civic centres for marketing, medical, legal, and other

other purposes. It cannot be termed a reasonable service if one mixed train only is run each way on two or three days per week, leaving no opportunity for a return journey the same day. Such a service invites competition by motor vehicle, of which signs are evident in several directions (Q. 861). Moreover, it is not calculated to develop travel. Most of the lines with such a poor service are non-paying, but obviously the few trains run do not give the lines a fair opportunity of showing the full value of railway communication. Railways should not only be made but equipped, and the evidence (Q. 167) is that for monetary reasons they are not equipped.

#### **Rail Motor-car Services should prove Successful.**

333. Several rail motor-cars have been built, but unfortunately engine design has proved faulty, and, with the exception of one at Lismore, which runs a service over two branches and pays well, the others, for the reasons stated, have not given the increased facilities they might otherwise have done. As an influence in the amenities of bush life, apart from the question of reasonable facilities, it is desirable that this method of serving branch and country lines generally should be developed, and that, as engines become available, the country train services augmented. Rail motor-cars are utilised to an increasing extent in many countries, notably in the United States, where it is estimated that approximately 7,000 miles of track are operated by this means. There is every reason to expect that well-designed cars will prove equally successful in New South Wales.

#### **Characteristics of Sydney Suburban Traffic.**

334. The Sydney suburban train service (the district between Milson's Point and Hornsby excepted) differs from that serving most large cities, inasmuch as it is centred on one station only. As a rule, suburban lines distribute passengers at a number of city stations, and at several termini, but in Sydney the concentration of traffic to and from all lines is an inevitable source of congestion. So much is this so, that, at the peak hours of traffic, the approach lines, as well as the station, are nearing the saturation point. The population of Metropolitan Sydney is increasing, according to statistical records, at the rate of from 25,000 to 30,000 per annum. The number of passenger journeys on the railway increased from 45,557,506 in 1910 to 73,180,876 in 1914, and in the year ended 30th June, 1924, were 111,964,774. It is estimated that, by 1930, over 180,000,000 passenger journeys will be made annually, this representing an increase in travel of over 200,000 journeys per week-day as compared with 1924. If this eventuates, and unless the City Railway is carried through to completion and the suburban lines are electrified by that time, a state of affairs verging on the chaotic may be expected.

#### **First and Second Class Fares should be Revised.**

335. Notwithstanding the heavy traffic and the use of "a fairly large number of goods engines" (Q. 675) the suburban trains as a rule keep good time, but there is occasional overcrowding, while numerous complaints arise from the alteration of first-class compartments into second and *vice versa*. This is said to be due mainly to a shortage of carriage stock and to the fact that unsuitable main line stock has, in consequence, to be used on suburban trains. There is, however, another feature noticeable in the suburban as well as in the country passenger traffic which accounts for some of this trouble, viz., the drifting of first-class passengers to the second-class. The increase in fares, being on a percentage basis, has introduced too wide a difference between the respective classes, with a resultant loss of first-class traffic. There is a point of difference between the cost of first and second class fares which defeats the object in view of increased price, *i.e.*, the securing of more revenue. Results show that that point of difference between first and second class has been passed, and we therefore suggest a review of the fares.

#### **Milk, Fruit and Butter Traffic.**

336. The parcels traffic conveyed by passenger train is considerable, yielding a revenue of £600,000 per annum. The volume of milk, fruit and butter conveyed by passenger trains is large, adequate arrangements being made to give speedy transit. Milk in cans of 5 to 10 gallons, and in fixed vats of a capacity of

of 500 to 700 gallons, or portable vats holding 250 gallons, is to some extent loaded in private milk vans. Departmental vans with fixed vats are also provided. This commodity travels considerable distances up to 235 miles.

337. Fruit special trains are run under a guaranteed minimum load of 75 tons. Fruit conveyed by passenger trains to Sydney is transferred to Darling Harbour, adjacent to the Municipal Fruit Markets. Small consignments are delivered from the Central Station. Butter is loaded in louvred vans on passenger trains, and in refrigerating cars on mixed trains. The longest haul is about 340 miles. These important commodities are dealt with in a satisfactory manner, and the same may be said of parcels traffic in general.

#### **Goods Traffic.**

338. As in the case of the passenger, so goods traffic demands a service mainly to and from Sydney as the centre of marketing and exporting business. The tonnages inward and outward do not balance, and, as a result, there is considerable running of empty vehicles from Sydney to the country, the annual figures being 280,000 empty to 180,000 loaded wagons. The maximum load of any goods train is 900 tons. The trains are run at about 16 miles per hour, and, under all the circumstances of single line crossings, the presence of numerous special trains and delay by passenger trains out of course, are fairly punctual and give satisfaction to freighters.

339. There is, however, complaint of delay to small consignments too light for a truck-load to destination. This indicates detention at transshipping stations, due to laxity of local supervision. In addition to selected transfer stations, it is the practice to accept goods for certain stations on two or three days only each week in order to concentrate loads as far as possible in truck loads from one or two places. With such a large number of empty wagons going out to country stations it would appear advisable to give more direct loading even at the expense of light loads, the empty vehicles having in any case to be hauled to the country for back-loading with grain and other produce.

#### **Transfer over Clarence River at Grafton.**

340. As the lines north of Grafton are cut off from rail access southward, arrangements are made to transfer small consignments across the Clarence River, but for any bulk traffic consignees have to make their own arrangements for effecting an exchange between the two railheads. We understand that progress is being made in the direction of providing a punt with the necessary landing appliances capable of transporting railway vehicles from one side of the river to the other. This is certainly desirable, pending the construction of a bridge, which, especially in view of the decision to construct the Kyogle-South Brisbane Line on the 4 ft. 8½ in. gauge, should not be delayed.

#### **Grain Traffic.**

341. Grain traffic in successful seasons is calculated to tax rolling-stock resources to the utmost. But for the well-arranged and rapid movement of this traffic and the return of empty wagons, many complaints would undoubtedly have arisen. There has been complaint of non-acceptance of grain, brought about by irregular arrival of grain ships, numerous wagons having been held up at the port in consequence, thus leading to a restriction on loading at the country centres. Blame cannot, however, be attached to the Railway Department for this difficulty, and we are satisfied from our investigations that every attempt is made to meet all reasonable demands.

#### **Livestock Traffic.**

342. In New South Wales—mainly dependent, as it is, upon its flocks and herds—the running and equipment of trains for livestock traffic demands special consideration. Prior to December last complaints of slow movement, with consequent loss, deterioration and suffering of animals, were numerous. Since that date, however, livestock trains with limited loads have been run at passenger train speed, but there is still need for better transport of smaller numbers. Although this request means extra cost it is reasonable to expect that it should be dealt with.

### Comparison with the Argentine.

343. In the Argentine where, as in New South Wales, large numbers of sheep and cattle are conveyed by railway, Government regulations are drastic. The transport of livestock must be effected within the specified times laid down in the regulations under penalty of forfeiting a part of the freight proportionate to the extent of the delay. The time for transport begins to count as from two hours after receipt of the animals, *i.e.*, after they have been loaded into the wagons and these made ready to go forward. The hour from which the time begins to count is registered on the invoice. Apart from the carriers' liability to lose part of the freight, any delay stands against the carrier in the event of mishap overtaking the animals. The fact of there having been a delay is assumed to imply that the transport was not effected under normal conditions. The maximum time allowed for livestock transport is as under:—

Distance. Kilometres.	Time Allowed.	
	Hours.	Minutes.
50	5	...
100	10	...
150	13	15
200	16	45
300	20	45
400	24	45
500	28	45
600	32	45
700	36	45
800	40	45
900	44	45
1,000	48	45

344. It is strictly forbidden to keep animals in the wagons over thirty hours, save in cases of *force majeure*. In such an event the animals are unloaded at a convenient place where fodder and water are provided on account of the freighter. The charge for this service varies according to the season of the year. The carrier simply charges what the contractor collects for supplying the hay. The carrier supplies the water free of charge. The contractor's charge for the hay is inserted on the waybill and is payable at destination before the livestock is withdrawn. All the stations loading livestock are equipped with suitable installations for the purpose, *viz.*, a fairly large-sized pen and loading stage, drinking troughs, &c. The party loading livestock must have the animals at the station in time to enable them to be loaded into the wagons two hours before the appointed hour of departure.

345. We mention these regulations because of the similarity between the movement of livestock in New South Wales and the Argentine. An idea of the importance of livestock traffic in the two countries may be gathered from the record of numbers conveyed per annum, *viz.*, New South Wales (1924), sheep, 8,000,973; cattle, 780,558; Argentine, sheep, about 14,000,000; cattle, 5,000,000 to 6,000,000.

### Insufficient Vehicles to meet full needs of Livestock Traffic.

346. It is admitted that there is an insufficient number of trucks to meet the full demands of livestock traffic in time of drought. We do not think such a shortage should exist. Vehicles should be available either for conveying sheep and cattle to market or for the transfer of starving stock from one district to another. In countries where companies own and manage railways, the Legislature insists upon all transport needs being met, and such would undoubtedly be the case in New South Wales but for the fact that the railways are State owned and managed. Clearly what a State would require public companies to do, it should itself perform where it controls the means. The type of truck that should be built to meet drought emergencies should be solved, and we refer to this elsewhere in the Report.

347. We suggest that instead of a general instruction to stationmasters and guards to see that loss and suffering of animals *en route* do not occur, it would be preferable to equip certain stations on each route for examination, watering and attention, the necessary interval being allowed in the timetable for this purpose.

#### Coal Traffic.

348. Coal traffic accounts for 53 per cent. (8,354,479 tons in 1924) of the total freight tonnage conveyed, and, being slow-moving traffic, calls for powerful engines in the interests of economy, and strict time-keeping to avoid delay to other trains. New South Wales is blessed with good coal measures over a wide area, the principal output at present being from the Newcastle field. Of 6,635,552 tons lifted, 3,622,824 tons were shipped at that port as freight or for bunkering. Complaint is made of the times at which trains are fixed to leave the collieries, but there would not appear to be undue delay in dealing with coal generally, excepting as the result of engine failures and the absence in times of pressure of sufficient berths and cranes to deal promptly with tonnages; for the latter, the Railway Department is not responsible. The Colliery Companies provide wagons for shipping coal, but for inland consumption railway departmental vehicles are used. There is at times a shortage of these wagons. The weight of trains hauled having regard to engine capacity and the loading of wagons is satisfactory.

349. From the Illawarra field 1,106,088 tons were conveyed, and from Western pits 644,983 tons. The former is shipped at Sydney and Port Kembla, and home consumption is for the most part in Sydney. Colliery wagons are available for the major tonnages, country districts excepted. Western pits supply Sydney and shipping, as well as country requirements in competition with the Illawarra field. No complaint has been made of movement in these areas.

#### Tonnage of Coal Handled.

350. The coal tonnage hauled from all coalfields in the Newcastle district from October, 1921, to June, 1924, is as under:—

October, 1921	...	...	...	449,480 tons.	
March, 1922	...	...	...	478,444	"
June, 1922	...	...	...	426,728	"
September, 1922	...	...	...	427,022	"
December, 1922	...	...	...	393,281	"
March, 1923	...	...	...	476,469	"
June, 1923	...	...	...	274,522	" (Maitland field strike).
September, 1923	...	...	...	574,212	"
December, 1923	...	...	...	574,212	"
March, 1924	...	...	...	541,761	"
June, 1924	...	...	...	491,183	"

and it will be seen that, although the coal output appears to have a slight tendency to increase, it is by no means regular, one month varying considerably as against another.

351. In regard to the Maitland field, which includes the Maitland field collieries served by the South Maitland Railway Company, and, in addition, those collieries north of Maitland, viz.:—South Greta, Whitburn, New Greta, Great Greta, Central Greta, and Rothbury, the following outputs were recorded:—

October, 1921	...	...	...	265,547 tons.	
December, 1921	...	...	...	284,477	"
March, 1922	...	...	...	319,425	"
June, 1922	...	...	...	287,465	"
September, 1922	...	...	...	281,652	"
December, 1922	...	...	...	254,735	"
March, 1923	...	...	...	278,155	"
June, 1923	...	...	...	34,761	" (Maitland strike).
September, 1923	...	...	...	348,819	"
December, 1923	...	...	...	249,303	"
March, 1924	...	...	...	356,818	"
June, 1924	...	...	...	311,586	"

The same variation in output is noticeable in these figures as is found in those quoted earlier. While there would appear to be a slight tendency to increase, the output varies from month to month, and the increase falls a long way short of the 50 per cent. increase in output stated in evidence.

#### **Improved Facilities for Coal Traffic.**

352. In regard to the allegation that the Railway Department has made no provision to meet any increased output, the Chief Traffic Manager states that during the last two years, eight additional trains daily were tabled to meet the output of the Maitland field served by the South Maitland Railways Company alone, and most of these were to meet the increased output from the Aberdare Collieries. The whole of the collieries on this field have more than an ample train service to carry their present output.

353. In addition to this, engine power working in coal traffic has been improved. For example, in September, 1922, 51·24 per cent. of the coal trains from East Greta Junction were worked by heavy engines. This has gradually been increased. In August, 1923, the number reached 85·24 per cent.; in December, 1923, 85·05 per cent, and in June, 1924, 81·67 per cent, while the load has been increased practically from 535 tons to a maximum of 610 tons.

354. The regulations permit every colliery to despatch each day one train with 50 per cent. of its load. Taking the collieries as a whole in this district, this means that quite a number of them, having only one train per day, fall short of a full load. This applies more to collieries outside the South Maitland field, although there is a fair percentage of the collieries within this field which takes advantage of this concession, and it is said that the average coal load from the Maitland field will not exceed 530 tons, while the engine power is in the vicinity of an average of 50 tons higher.

#### **Special Trains.**

355. A very large number of special trains is run across country, notably in times of stock movement. Water trains also account for many trains not shown in the working time-tables. As an indication of the measure of these irregular trains, it is noted that 51·10 per cent. special to ordinary run in the Parkes district in one year. The presence of such a number of unscheduled trains must adversely affect the time-keeping of regular services, especially on single lines. It is desirable that, where possible, conditional timings should be printed in the working time-tables in order to give the best possible service, and also for the information of the staff. It is stated that difficulty exists in foreseeing the times at which these trains will be required, particularly so where water trains are concerned—the latter amounting to as many as 329 per month under drought conditions—and these, no doubt, are difficult to deal with; but, at any rate, some of the remainder could with advantage be given conditional running time-tables.

#### **Facilities at Terminal Stations.**

356. The terminal stations and depots at Sydney are in the main managed in a satisfactory manner. The Central Station, now under rearrangement in connection with the City railway, has, however, reached that stage when it is subject at intervals to congestion, which electrification and the opening of the City railway should cure. It is a matter for congratulation that those who were responsible for the building and lay-out of this important terminus looked far ahead and gave Sydney a station not only architecturally good, but so effectively laid out as to be able to deal easily with a much larger passenger traffic than appeared probable at the time it was erected. A minor improvement in operating efficiency would result from the employment of electric luggage barrows now common at most large terminal stations.

357. The outwards goods depot at Darling Harbour is comparatively new, the handling, loading, and despatch of traffic giving general satisfaction. Accommodation for inwards traffic needs laying out afresh, but, notwithstanding obvious disadvantages due to traffic having outgrown shed and stage capacity, there is little public complaint. An application for extension of time during which goods are received at Darling Harbour had better be left as it is in the interests of throughout rapid conveyance.

#### **Defects**

### Defects at Newcastle.

358. At Newcastle the same record cannot be claimed. The whole lay-out, both of passenger and goods accommodation, calls for rearrangement. The Commissioners have long recognised this, but absence of funds has been an obstacle to any considerable expenditure in that direction. Valuable land which could well be sold to the advantage of the railway and the amenities of the town is the site of old buildings and yards, which could better be placed elsewhere (Q. 3507). At present North and South bound Mail and Interstate trains run into and out of a dead-end station, this involving delay to through passengers. A preferable arrangement would be an improvement of Broadmeadow as a through line station with connecting services to and from the terminal station. Newcastle is the second town in importance and size in New South Wales; its traffic and population are increasing rapidly, and deserve far better railway facilities than exist to-day. Many of the complaints originating there should yield to the local management recommended in Part III of our Report under the head of "Organisation."

### Traffic Exchange Points and Facilities.

359. At Albury, Wallangarra, and Tocumwal the transfer of passengers from and to Victorian and Queensland trains is as good as can be devised under the circumstances attending the break of gauge. With regard to the loading and unloading of goods traffic at Albury, improved mechanical or electrical appliances would lead to quicker despatch of traffic. If there be any prospect of uniformity of gauge linking up the capitals of the States, it would scarcely be worth while to alter existing machinery, but if the imaginary line dividing Victoria from New South Wales is to perpetuate the break of gauge, which would not be tolerated within the confines of a single State, then the expenditure necessary to replace hand-worked cranes and other appliances will be justified.

360. Other terminals meet public requirements and are free from complaints.

### Movement of Rolling Stock.

361. Passenger stock generally is admittedly short in number, the best being done in the composition and arrangement of trains under the circumstances prevailing. This shortage affects not only existing services, but prevents the running of additional trains desired on many parts of the system.

362. Goods and live-stock wagons are controlled as to movement by the Superintendent of Goods and Live Stock Transportation. The former are said to be sufficient for present tonnages, although it is certain that, but for the very efficient way in which these vehicles are manipulated to and from producing centres, a shortage would be felt. Loaded goods wagons from Sydney numbered in twelve months 177,383, as against 272,710 run away empty. The record for live-stock vehicles in the same period gives 15,958 loaded outward and 55,503 empty. Throughout the railway unbalanced wagon movement is apparent. This makes supply difficult of adjustment; it is well done, however.

### Weighbridges.

363. Complaints of inconsistency between weighings at forwarding and receiving stations were voiced by several witnesses, some of them originating from a desire to make use of railway weights for buying and selling purposes. Railway weighbridges are tested by official inspectors under general law, they are subject to periodical overhaul, repair and test by competent railway men, and there should be no question of their accuracy. In cases where it is proved that a greater weight has been charged for than is actually conveyed, the overcharge should immediately be refunded.

### Cleaning of Carriages.

364. There appears to be justification for complaint of dirty carriages on certain trains. It must be recognised, however, that, with a shortage such as exists in this class of vehicle, it is not easy to do full justice to the whole of the carriage

carriage stock. Still the importance of cleanliness cannot be put too high, and by the provision of vacuum cleaners for interiors, the carriages of trains at the starting point should lack nothing in that direction.

**Accidents.**

365. The record of New South Wales Railways in comparison with other countries is good under this head. It applies to accidents to employees as well as to the public. Propaganda by "Safety first" rules, with the constant reminder of need for caution has no doubt had a beneficial influence in this direction during recent times.

**Lighting of Trains.**

366. The complaint under this head will, we gather, be obviated by the provision of electric light in place of gas, which the Commissioners are proposing gradually to instal on all but the very oldest stock.

**IV.—MANAGEMENT.**

**(g) RATES AND FARES.**

367. Under the Railway Acts a clause dealing with tolls provides that:—

"(1) The Commissioners may carry and convey upon the railways all such passengers and goods as are offered for that purpose, and may demand reasonable tolls and charges in respect thereof.

"(2) Subject to the provisions of this Act, all such tolls shall, at all times, be charged equally to all persons, and after the same rate, whether per ton, per mile, or otherwise, in respect of all passengers and of all goods or carriages of the same description, and conveyed or propelled by a like carriage or engine passing over the same portion of the line of railway and under the same circumstances; and no reduction or advance in any such tolls shall be made, either directly or indirectly, in favour of or against any particular company or person travelling upon for using the railway."

**Passenger Fares.**

368. The scale of ordinary fares in operation for passengers travelling within the Suburban Area, *i.e.*, to places radiating for a distance of 34 miles from Sydney and Newcastle respectively and including Richmond, 38 miles on the Western Branch Line, is:—

Second Class (Single)	First mile	...	...	...	...	2d.
	2 to 8 miles (per mile)	...	...	...	...	1d.
	Each succeeding mile	...	...	...	...	$\frac{3}{4}$ d.

First Class.—Second Class plus one-third.

The return fares are:—

First Class.—Double the Single.

Second Class.—Double the Single less 1d. except in regard to a few short distances.

369. The fares between all Stations outside the Metropolitan and Newcastle Suburban Areas (Single fares only) are based on the following scale:—

<i>Miles.</i>	<i>Fare per mile Second-class.</i>					
1 to 100	...	...	...	...	...	1.75
101 „ 200	...	...	...	...	...	1.52
201 „ 300	...	...	...	...	...	1.5
301 „ 400	...	...	...	...	...	1.32
401 „ 500	...	...	...	...	...	.85
501 „ 600	...	...	...	...	...	.85
601 „ 700	...	...	...	...	...	.85
701 „ 800	...	...	...	...	...	.85
801 „ 900	...	...	...	...	...	.85
901 „ 1,000	...	...	...	...	...	.85

The first-class fares are the second-class fare, plus 50 per cent.

**Suburban**

### Suburban and Country Fares.

370. The fares from Sydney or Newcastle, also from stations in the Metropolitan and Newcastle Suburban Areas to all stations outside these areas and *vice versa* are computed by adding the fare for the distance travelled over the Metropolitan and Newcastle Suburban Areas to the fare for the distance outside. For example :—

					Single.	
					First Class.	Second Class.
					s. d.	s. d.
Sydney to Katoomba, 68 miles—						
Metropolitan Area : 34 miles—“ A ”	...	...	...	...	3 2	2 4
Country „ 34 „ —“ B ”	...	...	...	...	7 5	4 11
					10 7	7 3

The fares between Sydney and Melbourne, and Sydney and Albury are—First-class £4 and £3 14s., and second-class £2 13s. and £2 9s. 7d. respectively.

### Anomalies in Fares.

371. Anomalies in the list of fares charged for passengers, both first and second class, as between interstate and local, and also between the suburbs and the country, have been the subject of complaint. The justification for lower fares between State capitals is sea competition, the arbitrary sum of the reduced fares being divided between the several State railways in proportion to the mileage run over each. It is held that a passenger from a station other than the capital should not expect to travel at the same proportionate rate as a fare fixed for the purpose of obtaining revenue which would not accrue to the railways, but for the inducement offered by a lower fare to prefer the rail to the sea. Accepting this as a reasonable proposition, it cannot be said that the difference in the ordinary fare for suburban and country travel is accounted for by the cost of conveyance in the country being higher than in the suburbs. Neither can it be demonstrated that a country passenger receives a greater benefit by way of speed or comfort in travel; rather the contrary, especially in the case of mixed trains, of which so many are run. The measure of disparity is brought out forcibly by the instance given of fares from Sydney to Katoomba. The fare for 34 miles on suburban lines is 3s. 2d. first, and 2s. 4d. second class as against 34 country miles 7s. 5d. first and 4s. 11d. second.

372. It is not quite clear how the difference in charge as between town and country was established. It has existed for many years. Unfortunately, to adjust the fares at this juncture by making the rates per mile identical would involve a loss of revenue too heavy to be borne. We suggest, however, that at the earliest opportunity, and as revenues improve, the country fares should be reduced, such reduction being regarded not as a total loss, but as a means of inducing increased travel by a cheaper fare, thus offsetting to some extent the loss in revenue that must be faced.

373. A large number of reduced fares for workmen's and week-end tickets to popular resorts are in operation. Probably an extension of week-end tickets to and from the country would increase revenue, and we think that cheap market tickets by certain trains issued on one day of the week, preferably in the middle of the week, would prove as popular and pay as well as such facilities do in other parts of the world.

### Increases in Passenger Fares.

374. Increases in passenger fares since 1914 are shown hereunder :—

Date.					Suburban Scale.	Country Scale.	Periodical.
					Per cent. Increases.	Per cent. Increases.	Per cent. Increases.
8 August, 1917	...	...	...	...	10	10	10
1 November, 1918	...	...	...	...	7½	7½	7½
1 January, 1920	...	...	...	...	20	20	20
1 November, 1920	...	...	...	...	16⅔	16⅔	16⅔
Actual percentage on 1st November, 1920, over pre-war bases					66	66	66

### Reduction in Fares and Parcel Rates.

**375.** Reductions in passenger fares and parcel rates, involving a loss of revenue exceeding £100,000 per annum, have been made since 1922. Various reductions have been made since 1st May, 1922, as follows :—

- 1 May, 1922—1st class periodical fares adjusted to 2nd class, plus 50 per cent., representing reductions ranging to 13 per cent. for mileages over 30, and up to about 600 miles.
- 12 Dec., 1923—2nd class country single fares decreased for mileages over 500, ranging up to  $6\frac{1}{2}$  per cent. 1st class country fares slightly decreased up to 100 miles, up to 6 per cent. to 200 miles, and from about 7 to 15 per cent. for distances over 200 miles.
- 1 May, 1924—2nd class suburban fares up to 34 miles decreased 3 to 11 per cent.; 1st class, 7 to 25 per cent. Over 34 suburban miles 2nd class decreased 8 to 18 per cent.; 1st class 23 to 27 per cent.
- 1 May, 1924—New scale introduced for periodical tickets within the Metropolitan and Newcastle Suburban areas, representing a reduction on previous charges ranging to about 2 per cent. up to 50 miles, 2nd class. Reductions on 1st class tickets ranged from 11 to 13 per cent.—rates being fixed at 2nd class, plus one-third, instead of 2nd class plus one-half as formerly.

### Parcels Rates.

**376.** No complaints have been raised with regard to the parcels rates. These are reasonable, especially so in regard to milk, butter and fruit. Consignments of milk and cream are carried under "Owners' Risk" conditions, and, if carried in owners' vans, are charged at the rate of 1s. 2d. per four wheels, minimum 41s. 6d., and the van is returned free. If Departmental louvered vans are used, a hiring charge of £1.0s. 9d. per week additional is enforced.

**377.** Milk carried in cans in passenger train brakevans is charged for on a sliding scale for distances from 7 to 300 miles, the rate from 201 to 300 miles being  $3\frac{1}{4}$ d. plus one-sixth per gallon, while for 301 miles and upwards  $4\frac{1}{4}$ d. plus one-sixth per gallon is charged. The carrying capacity of the cans used is 5 and 10 gallons each. In regard to the vats, the capacities differ, but this does not affect the freight, as it is charged on a mileage basis per van. The capacity of fixed vats in Departmental and private vans varies from 500 to 700 gallons, while portable vats will hold 250 gallons.

**378.** Seasonal fruits are conveyed in bogie louvered vans by passenger trains, under "Owners' Risk" conditions, and at goods rates, viz., miscellaneous in full truck loads, plus 25 per cent., minimum, 6 tons per 4-wheeled vehicle, 12 tons per bogie truck; and for smaller quantities "A" class on the actual weight. Fruit specials are run when a guarantee is given for a minimum load of 75 tons, ordinary goods rates as shown above being charged.

**379** Fruit is charged at half parcel rates on the bulk weight. If cheaper, the following rates are charged for any distance conveyed at the convenience of the Department :—

	Per case.
	s. d.
In cases not exceeding half-bushel size ... ..	1 0
In cases exceeding half-bushel, but not exceeding bushel size ... ..	2 0
In cases over bushel size, approximately $2\frac{1}{2}$ cubic feet in measurement ... ..	2 9

When two or more cases secured together as one consignment do not exceed the capacity of one half-bushel or bushel case respectively, the charge is as for half-bushel (1s.) or bushel case (2s.).

**380.** Butter is conveyed by passenger and mixed trains. Bogie louvered vans are used on passenger trains, and refrigerating cars on mixed trains. Consignments are carried under "Owners' Risk" conditions, and at ordinary goods rates, viz. :—

Full truck loads "A" rate (Subject to a maximum charge of 1s. 9d. per box, not exceeding 66 lb. gross).

Smaller quantities, "B" class rate, minimum 4 tons per 4-wheeled, and 8 tons for bogie refrigerator cars.

### Goods Rates.

**381.** The pre-war classification of merchandise was in the main based upon what the traffic would bear in the shape of a conveyance charge. Other factors such as the encouragement of wheat production, development of industries, and to some extent the cost of haulage, were elements in the decision to include articles in

in a particular class. The objective of a goods classification is to secure a given amount of Revenue, *i.e.*, general railway expenditure, including interest, by an equitable division of conveyance charge as between the various classes of traffic having regard to the character, value, and other considerations attaching to each item. No one has yet been able to devise a classification to please everybody. Comparisons are constantly being made between the value, cost of conveyance, or the national importance of one article and another, with the object of bringing an article into a lower scale. Revisions of classifications are frequent, and New South Wales affords no exception to this rule. The present classification with many modifications introduced during the last two years is as follows:—

NUMBER of Commodities carried under various Classification Rates:—

- |   |   |   |  |
|---|---|---|--|
| 1. Crude Ores—<br>Antimony.<br>Bismuth.<br>Crude fuller's earth.<br>Crude ochre.<br>Crude silica.<br>Gold.<br>Lead.<br>Iron.<br>Copper.<br>Silver.<br>Manganese.<br>Tin (lode and stream).<br>Ores.<br>Oxide of iron.<br>Pyrites.<br>Magnesite. | 6. Miscellaneous ( <i>con'td.</i> )<br>Lead (bullion, scrap, or pig).<br>Molasses.<br>Wire-netting.<br>Drain-pipes.<br>Rock salt.<br>Stone.<br>Tiles.<br>Timber.<br>Lime. | 10. "A" ( <i>continued</i> ).<br>Wines and cider, made in Commonwealth.<br>1 ton lots.  | 13. 1st—<br>Animals and poultry in crates, alive.<br>Bread.<br>Candles.<br>Ceilings, metal sheets.<br>Dates.<br>Dried fruits.<br>Dyes.<br>Furniture, in vans.<br>Houses, wood, portable.<br>Jam, packed.<br>Meat, preserved.<br>Pork, beef, mutton.<br>Rope, grass.<br>Sheep's tongues, tinned.  |
| 2. Gravel—<br>Ashes.<br>Clay.<br>Soil.<br>Gravel.<br>Road metal.<br>Screenings.<br>Sandstone.<br>Rubble.<br>Ballast.  | 7. Hay, Straw, Chaff, &c.—<br>Hay.<br>Straw.<br>Chaff.<br>Greenfodder.<br>Ensilage.   | 11. 382. Additional revenue had, perforce, to be obtained during and after the war in order to balance the increased cost of operation, and a gradual advance in goods rates was made in New South Wales as in all other countries. The subsequent adjustment and reduction of many of these rates have proved very difficult, inasmuch as the mileage rates prior to 1913 under the different classes were made up by scales, the rate per mile decreasing as the distance increased; but the scales for one class did not depend on the scale for another, therefore, the increase or decrease of one rate compared with another might be 30 per cent. at 50 miles and 60 per cent. at 500 miles.

### New Scales of Rates.

383. The various percentage increases effected between 1913 and 1921 destroyed these scales, and, in the issue of the Merchandise and Livestock Rates Book, dated 11th January, 1922, new scales were introduced. The object was to make the scales for one particular rate, and to work all other rates on that scale by increasing or decreasing on a percentage basis. It was considered advisable to make the Miscellaneous Class Rate the basis for the scale, and this was introduced. From this scale—

"A" rate was taken as 1.75 of the Miscellaneous Class Rate.  
 "B" " " 2.50 " "  
 "C" " " 3.50 " "

and it was found that these could be introduced without any material increase or decrease on the rates then in operation; but in respect of manures, coal, first and second class rates the intention was to make—

Manure rate, .375 of the Miscellaneous Class Rate  
 Coal rate, .75 " "  
 1st class, five times " "  
 2nd class rate, six times " "

It was discovered, however, that the increase or decrease which would be caused in respect of manures and coal up to 200 miles, and first and second class rates up to 250 miles was too great, as it meant a large decrease in revenue which the Department could not bear, or, as an alternative, a large increase on the coal and general goods, which latter mostly would be sent to the country for the use of settlers there, and, as a temporary measure, rates had to be adopted which had no dependence on the Miscellaneous Class Rate up to the distance shown above.

384. The same was found to exist in regard to the rates on hay, straw, and chaff, agricultural produce, and wool and crude ores where new bases had to be adopted, but the declared intention is at the earliest possible moment to base these on a percentage of the scale adopted for the Miscellaneous Class Rate.

385. The percentage increases in freight rates since 1913 have been as follows:—

Description of Traffic.	Percentage Increase.	Date Increased from—
	Per cent.	
Manure, to 229 miles ... ..	10	12-12-16
Manure (all distances) ... ..	7½	1-11-18

Revisions amounting to an annual loss of revenue of some £600,000 have since been made in the scales, while variations, primarily in classification on 11th January, 1922, accounted for certain slight increases and decreases.

Freight Classification.

386. Having regard to the magnitude of the goods traffic, complaints of the classification and of the rates are remarkably few. At Newcastle general complaint was made of the classification, but at Sydney the representatives of the Chamber of Manufactures asserted (Q. 3214) that no objection was raised at the present time as to the fairness of the classification.

Tapering of Rates.

387. Objections to the tapering of rates, emanating from Newcastle, we do not regard as valid inasmuch as the principle applies in all directions and is very unlikely to affect adversely as a whole the trade of any town or district. Where a loss might arise in one direction, it would stand to gain in another. It is common practice to taper rates according to distance. Unless a difference in rates be very great, it is not the general experience that trade is diverted from one centre to another solely by reason of railway charges. Sir Mark Sheldon stated the influence governing trade location very clearly when he said (Q. 1966):—

“The wool-grower is not going to send his wool to some new port or some new market simply because it happens to be near his door. It may cost him a little less in trainage, but he is going to send it to the best market where he can get the best price. The matter of trainage or freightage is a very small item compared with the competition which you can get in a big market, and although it would be very convenient for him for his personal convenience, or it may be for his district, and so on, I do not think he would be prepared to sacrifice his pecuniary interests for the sake of the district, or for the sake just of the sentiment of opening a new port.”

388. A question of rates from Sydney northward being on a lower scale than from Sydney southward, and said to be to the detriment of Newcastle, has been brought about by sea competition. Rates charged from Sydney northward on a lower scale than to the south apply also from Newcastle to Sydney and intermediate stations. There is, therefore, no difference of treatment between the two cities. It is true that rates from Sydney to places north of Newcastle are on a lower scale than from Sydney southward, again indirectly in competition with the sea, but we cannot find that the sum of such rates would affect Newcastle trade with those places. If there are any instances calling for adjustment, which we have not discovered, it will be advisable to deal with them promptly.

389. There is evidently an idea that a considerable proportion of the traffic is conveyed under existing rates at cost or even at a loss. This view is incorrect. The charges yield a fair return after meeting conveyance and general costs of upkeep and administration.

390. A complaint of rates for apples being 60 per cent. higher than the rates for potatoes is met by the perishable nature of the one demanding more speedy and careful transit than the other, which travels by slow goods train.

#### Rates for Fodder.

391. A grievance voiced by Dr. Norman Kater, M.L.C., President of the Graziers' Association (Q. 2270) should be capable of adjustment, at any rate until sufficient wagons are available to deal adequately with fodder in times of drought. Reduced rates are in operation during drought periods for fodder destined for starving stock, but difficulty arises at that particular time by reason of wagon scarcity. It is suggested that reduced rates might be given at times when traffic upon the railway is light, a safeguard against abuse being provided in the shape of a declaration that the fodder is to be used in times of drought only. In this, as in cognate questions, the national value of primary or secondary industries demands recognition and help apart from the measure of profit at any given moment. That the Commissioners are not unmindful of this is shown by concessions given and the efforts they have made within their resources to move starving stock, but it would obviously help if fodder could be secured beforehand and thus avoid in some cases the removal of sheep from one district to another at unremunerative rates. A live sheep is a potential source of revenue to the railway, and anything in reason that can be done to keep sheep alive is to the advantage of the Railway Department, in common with the owners, and the community generally.

392. At the same time the limitation of reduced rates for fodder for starving stock to distances 100 miles beyond the seaboard might well be reviewed in the direction of reducing the limited distance somewhat. There is much to be said for Mr. Fraser's view (Q. 4072) that:—

"Many of the carters in the streets of Sydney would, if we gave concession rates on fodder brought into this area, get advantage of that low-priced fodder and use it for purposes for which the fodder was certainly not intended. The same thing applies around Newcastle, and outside of that, of course, there is the fact that almost always in drought seasons there is feed on the coast of a sort—not the very best of feed, but there is generally natural feed, and it is not necessary to feed stock within the areas mentioned here as it is in the outside areas where there is no feed of any kind whatever. The main objection, of course, is that fodder brought into areas such as the surroundings of Sydney and the surroundings of Newcastle at concession rates would undoubtedly be used by a number of people not entitled to it."

#### Minimum Truck-load Rates.

393. Fixed minimum truck-loads were objected to on the ground that the bulk could not in certain commodities be loaded upon the trucks. This was met by the assertion (Q. 4540-2) that tests were made and demonstration shown to the contrary.

#### Differential Rates.

394. A number of witnesses deprecated very strongly the practice of charging less for certain articles of home manufacture than for imports of a similar character conveyed under like conditions. It was contended that it is not the function of the Railway Commissioners to apply what is in effect a tariff duty or preferential treatment to any industry, that being the function of the Federal Tariff Board. This view was taken by witnesses on behalf of the Producers' Association Central Council, the Apple and Pear Growers' Association, and the Australian Association of British Manufacturers and their representatives. We understand these or similar differential rates have been in operation for many years. The other side of the picture is given in a memorandum from Messrs. Lysaght Proprietary Company (see Appendix) and by Mr. Fraser (Q. 4115-9). This is a question not so much of railway management as State policy, and we must leave it at that.

#### Reductions

### Reductions in Rates.

395. That the Commissioners are alive to the desirability of bringing rates down to a point nearer pre-war is shown by reductions which, as before mentioned, result in a loss of revenue exceeding £600,000 per annum. These reductions include the following:—

Crude ores ... ..	£11,500	Ales, porter, vinegar, dried fruits, and fish, &c. ... ..	£26,000
Coal and coke ... ..	25,000	Preserved fruits, golden syrup, &c. ...	10,000
Residual oil ... ..	7,500	Fresh fruit, passenger and goods, interstate or full truck loads, &c. ...	45,000
Water and gas pipes to the country ...	5,000	Brandy, whisky, &c. ... ..	12,000
Wire rod and drawn wire ... ..	18,000	Agricultural produce ... ..	24,000
Grain, flour, vegetables, &c. ... ..	19,000	Plaster ... ..	5,000
Galvanised iron, rolled and drawn iron and steel ... ..	58,000	Stone ... ..	5,000
Gasoline, benzine, &c. ... ..	9,500	Tar ... ..	14,000
Arsenic ... ..	10,000	Tiles ... ..	7,500
Dept. Agriculture—		Timber for butter boxes, &c. ... ..	5,000
Galvanised iron, cement, metal, machinery, &c. ... ..	15,000	Butter paper ... ..	5,000
Artificial stock and poultry food ...	9,000	Single packages of butter, honey, eggs, &c. ... ..	9,000
Pig-iron ... ..	5,000	Various commodities charged at concession rates on up journey ...	15,000
Livestock for re-stocking purposes ...	5,000	Rates on Northern River Lines ...	12,500
Unprotected cast-iron and steel ...	2,500	Limestone... ..	5,500
Fencing wire ... ..	5,000	Manganese ... ..	7,750
Artificial manure... ..	2,000	Metal steel ceilings, terra-cotta air bricks, &c. ... ..	2,000
Sugar ... ..	10,000		
Road vehicles ... ..	4,350		

### Coal Rates.

396. Two claims for reduction of freight charges upon coal traffic have been made, viz., (1) that increases during and since the war should have been by flat rate of increase, *i.e.*, a similar amount per ton irrespective of distance, instead of a percentage increase all round, and (2) that a charge levied recently for tipping coal at Newcastle should be abolished. With regard to the former, the acceptance of the claimants' views, on the basis of securing the same revenue as at present would result in high flat rates, thus making the rates for short distances altogether out of proportion to those for a long haul. We consider that the introduction of a percentage increase upon pre-war rates was the most satisfactory and equitable method that could be adopted. In the second case the answer of the Commissioners (Q. 4215) is that the charge for tipping is made to cover costs of power production, interest on capital invested in power-house, on the reticulation of water mains, and on maintenance as well as for actual labour in tipping of the coal. It is true that for several years no such charge was made, but, with the necessity to secure more revenue, a gratuitous service could not in justice be continued. We consider the Commissioners' views are sound.

### Carriers Act.

397. Evidence was given advocating the inclusion of the Carriers Act in the Commissioners' obligations. There is evidently a misunderstanding upon this question, inasmuch as under section 33 of Act No. 30, 1912, the Railway administration come under the Carriers Act.

# V.—TRAMWAYS.

398. The tramways of New South Wales are controlled by the Commissioners under the conditions and obligations applicable to railways. Services are operated in the Metropolitan and Sydney suburban areas, in Newcastle and the vicinity thereof, and at Broken Hill, the total tramway mileage, electric and steam, open for traffic being 227½ miles. The number of passengers carried during the financial year ending 30th June, 1924, was 340,957,725, and the tram miles run, 32,110,054. The capital cost, including equipment, is £10,758,958. The earnings for the year 1923–24 were £3,633,916, against working expenses, £3,091,531, leaving a balance of £542,385, or £5 4s. 8d. per cent. upon the capital expended. The percentage of working expenses to receipts was 85·07. Earnings per tram mile were 2s. 3d., and expenses, 1s. 11d., or a return of 4d. per tram mile.

399. Comparisons between 1914 and 1924 are as follows :—

ALL ELECTRIC TRAM LINES.			STEAM TRAM LINES.		
Year.	Passengers.	Mileage.	Year.	Passengers.	Motor Mileage. Car Mileage.
1914	290,547,553	27,369,969	1914	20,045,145	1,441,774 2,821,282
*1924	323,652,752	30,675,479	1924	17,304,973	1,434,575 2,239,309
Increase ...	11·4%	12·1%	Decrease	13·7%	5% 20·6%

\* Includes Newcastle (opened partly, 17th December, 1923).

## COMPARISON 1914 with 1924.

Year.	Population Served.	Street Miles.	Length of Single Track.	Capital Cost.	Passengers Carried.	Revenue.	Expenditure.	Interest.	Profit or Loss.
All Tram Lines.									
1914	866,310	Mls. chs. 212 13	Mls. chs. 328 42	£ 7,628,653	310,592,698	£ 1,934,164	£ 1,669,033	£ 263,451	£ 1,680
1924	1,192,000	227 46	367 69	10,758,958	340,957,725	3,633,916	3,091,531	532,187	10,198
*All Electric Tram Lines.									
1914	722,620	145 59	252 27	7,054,832	290,547,553	1,781,063	1,520,185	242,694	18,184
1924	987,000	160 41	286 10	9,209,883	320,402,789	3,391,626	2,781,148	458,054	152,424
City and Suburban Electric Tram Lines.

1914	143,690	66 34	76 14	573,820	20,045,145	153,101	148,848	20,757	16,504
1924†	199,000	67 5	81 59	1,549,075	20,554,936	242,290	310,383	74,133	142,226

\* Newcastle Electric excepted.

† Includes Newcastle, part Electric.

## Profitable Tramway Services.

400. The Sydney City and Suburban lines, with 116 miles of tram line, and the Rockdale to Brighton-le-Sands (1 mile 20 chains), provided a profit over working expenses of over £568,000, and carried the burden of other sections, which exhibit a loss of £25,804, North Sydney (23 miles) and Manly to Narrabeen, and Manly to Spit (10 miles) excepted, these yielding a profit over working expenses the former of £36,372, but a loss of £15,874 after meeting interest, and the latter a profit of £11,965, but a loss after paying interest of £4,701.

Tramways

### Tramways Working at a Loss.

401. The following services were operated at a loss :—

Ashfield to Mortlake and Cabarita (8 miles) lost £6,047 on the working—£17,199 including interest.  
 Parramatta to Northmead (2 miles, steam) lost £4,485 after paying working expenses, and £5,419 including interest.  
 Arncliffe to Bexley (2 miles 50 chains, steam), lost £2,786 on working and £3,940 after meeting interest.  
 Kogarah to Sans Souci (5 miles 45 chains, steam) lost £6,585 and including interest £8,230.  
 Sutherland to Cronulla (7 miles 32 chains, steam) lost £3,671, and with interest added £6,430.  
 The Newcastle City and Suburban (35 miles 19 chains, partly steam, partly electric) shows a loss of £41,380 and including interest a total of £61,322.  
 East to West Maitland (4 miles 5 chains, steam) gave a loss of £766 and with interest £2,550.  
 Broken Hill (10 miles 4 chains, steam) shows a loss of £8,420, and including interest a loss of £12,955.

402. Increases in the number of passengers carried in 1923–24, as compared with 1922–23 are shown on the Sydney City and Suburban tramways of 7,374,133, Manly to Narrabeen and Manly to Spit 79,251, Ashfield to Mortlake 315,429, Arncliffe to Bexley 38,348, Rockdale to Brighton-le-Sands 227,587, Kogarah to Sans Souci 94,986, Newcastle City and Suburban 2,562,341, East to West Maitland 123,347, and Broken Hill 46,191.

### Steam-operated Trams cannot give Adequate Service.

403. From the foregoing figures, coupled with a study of the fluctuation in receipts over the past ten years, two facts emerge. Firstly, that motor bus competition is affecting all tramways : secondly, that steam-operated trams are out of date, cannot give an adequate service, and should be electrified at the earliest moment. Looking at the financial results in detail, and the probability of motor bus competition increasing, it would appear advisable to consider very carefully—indeed, with extreme caution—any considerable extension of the tramway system. The Commissioners recognise this by their intention to test routes already sanctioned for tramway construction by means of motor buses to be run by the Commissioners themselves.

### Electrification Proceeding Slowly.

404. The loss upon steam-operated tramways may be minimised or turned into a profit by electrification. At Newcastle this is proceeding slowly, the tardy substitution of the one system for the other being due to financial difficulties. It is intended to convert the Sutherland to Cronulla tramway into an electric railway in conjunction with the Illawarra line electrification. The loss at present on this tramway is, as will be seen, serious, mainly due to bus competition. When the change is effected, coupled with the growth of the popular resort of Cronulla, a profit should result. It is proposed to electrify the Arncliffe to Bexley and the Maitland tramways also.

### North Sydney Tramways and Railway Electrification.

405. The North Sydney tramways are at present a losing quantity, and with the proposed electrification of the railway—Milson's Point to Hornsby line—a further loss of fares may be expected; but, as pointed out by Mr. Doran (Q. 4390-1), the character of the traffic will change, the tramways then serving mainly as feeders to the railway instead of the ferry-boats. Furthermore, the possibility of growth in that district is great, and an increase of population should benefit the trams.

### Finance.

406. Our observations and recommendations under the head of finance upon railways apply also to tramways. We recommend that the Commissioners should control their own funds and make provision for further capital requirements. We also recommend that, as in the case of railways, reserves for renewal and obsolescence be provided, based on the estimated life of line equipment and tramcars. This totals £191,000 for line, based on a life of sixteen years, and £89,237 for cars. After deducting the mileage of line actually relaid and the cars renewed in 1923–24, also Capital items charged to Revenue, the profit upon working for the latter year is reduced to £388,648. We refer elsewhere to reserves for power-house plant and machinery.

Sydney's

### Sydney's Tramway System.

407. We are impressed with the operation of the electrically-worked tramways. Order and cleanliness are apparent within and without the depots. Timetables are well and conveniently fixed, and the method of collecting fares is simple, while the systems are amongst the best to be found anywhere. A notable feat is performed on race-days at Randwick by the movement of from a thousand to twelve hundred people per minute, and this often at times when large gatherings are catered for from other sports grounds. We think Sydney is to be congratulated upon the tramway system it possesses.

### Traffic Congestion in City Area.

408. Congestion at points within the Sydney City area is a matter of complaint. Tramways while providing cheap transit for the multitude, are not popular with many people because of noise and fixed street obstruction. In every big city to-day the problem of street congestion, brought about to a great extent by the advent of the motor vehicle, is the subject of serious discussion. In London, amongst other cities, congestion is at its worst where trams do not run. So great there is obstruction to movement that omnibuses progress within the City limits at the average rate of from three to four miles per hour. The fact is that, given enough traffic of any sort in any type of vehicle converging upon a comparatively small central area congestion must ensue. Whether vehicles roaming over the streets at will are less liable to cause street obstruction than trams fixed to a line of route and conveying the same number of passengers, is questionable. That the Sydney trams carry more people during the peak hours than would be possible with a similar number of motor buses is certain, and although the former do at certain times constitute what has been called a moving platform, they do no more than is necessary to provide for the traffic offering. The stoppage at each crossing street only is a decided advantage in so far as it affects pedestrians, and other vehicles, and the prohibition against the passing by the latter of trams at rest, whilst delaying other street traffic, is in the interests of safety, and no doubt accounts in a great measure for the comparatively small number of street accidents. The signalling safeguards also help in this connection. So long as people are compelled to make use of vehicles on the streets as a means of getting to and from the City centres congestion will arise, whatever form of transport is available. The immediate remedy, as in the case of the railways, is the completion of the City Railway and the electrification of suburban lines.

### Sections of Tramway Branch.

409. The Tramway Branch is divided into three sections—Traffic, Permanent-Way and Electrical—the latter being under the control of the Chief Electrical Engineer for Railways and Tramways (whose responsibilities are described elsewhere), while the others are supervised by a Tramway Traffic Manager and an Engineer for Tramways respectively.

### Organisation of Traffic Section.

410. The Tramway Traffic Manager is assisted by an Assistant Manager, two Indoor Assistants, one Outdoor Superintendent, and five District Superintendents. Three of the District Superintendents are located in the Sydney area (Eastern, Western, and North Sydney divisions respectively), while one is at Newcastle and one at Broken Hill, where he also controls the short isolated section of railway in that district.

411. Traffic operations are under the control of an Outdoor Superintendent, who is also responsible for the preparation of timetables, the provision of services for special requirements and for the allocation of the rolling-stock to the different depots.

412. The total staff in the Tramway Traffic Branch numbers 5,572, 449 being salaried grades, and 5,123 wages grades. The staff of signalmen, starters, drivers, conductors, checkers, cleaners, pointsmen and flagmen is located at sixteen depots in the Metropolitan area and is controlled by the Depot Masters in relation to the allotment of work, and by the Traffic Inspectors in the various districts in which they operate.

413. The traffic requirements call for the provision of rolling-stock as follows, this being the stock on 30th June, 1924 :—

					Steam Motors.	Passenger Cars.	Service Vehicles.	Total.
Electric Lines	...	...	...	...	...	1,570	92	1,662
Steam Lines	...	...	...	...	92	191	23	306
					92	1,761	115	1,968

414. The Revenue Section is controlled by a Superintendent of Revenue, who is responsible for the collection of revenue received, the accounting in connection with the cash-fare system generally, and the provision of adequate assistance to collect the revenue in ordinary and special traffic.

#### Organisation of Engineering Section.

415. The total single track mileage of tramways, including sidings, loops and cross-overs, for which the Engineer for Tramways is responsible is 423 miles. The Tramway Engineering Branch carries out the maintenance of all tracks (including the road surface) in connection with the tramway systems. In addition, the branch carries out duplications of existing tracks, small additions in the way of extensions and improved facilities for the handling of cars and the erection of car sheds, workshops, and buildings required in connection with the electrical equipment of the service.

416. The drawing office section of the branch is under the direct supervision of the Chief Assistant Engineer, and is divided into three groups, viz., Surveyors and Survey Draftsmen, Engineering Construction, and Architectural :—

1. The work of the former group consists of land survey work alignment of new and re-alignment of existing tracks; precise levelling, which includes re-grading of tramway tracks, and incidentally, streets; detailed survey work; design of curves and junctions; special work computations, and the setting out of works generally, including buildings and drainage.
2. The Engineering Construction Group carries out works of a general construction nature, as distinct from track work or architectural. This consists of preliminary plans and estimates, and, in the event of approval, working drawings.
3. The third group, Architectural, has similar duties to the preceding, with the exception that the work is confined to buildings only.

#### Re-laying Tramway Track.

417. In connection with re-laying, lists are prepared prior to the end of each financial year showing the amount it is proposed to undertake during the following twelve months. The life of the tramway track varies from approximately ten years under dense city traffic, to about twenty-five years on outlying sections. In the re-laying now authorised it is the practice to use 80-lb. T rails, with either a guard specially rolled for the purpose or with 60-lb. T rails recovered from railway works and flanged, the latter type being used on wood-paved sections and curves of sharper radii than 100 ft.

418. The whole of the re-laying work is done without interference to tramway traffic, and with as little as possible to vehicular traffic. The permanent-way is divided into sections, numbering forty-four in Sydney and suburbs; each is under the control of a ganger, who has under his direction a number of fettlers or labourers, and carts. The maintenance staff averages one for each mile of track, excluding carters, who number sixty-one for the whole of the system. Where continuous re-railing or heavy renewals are required, the work is done by a special gang.

419. Under the control of the Engineer there are in the Sydney and suburban districts four depots, the most important being at Woollah Creek, near the terminus of the Cook's River tramway. This is the principal receiving depot for permanent-way material, as well as the transferring depot for material required by other branches

branches (such as the Electrical Branch), which needs to be delivered to tramway electrical depots or workshops, or consigned from such depots to railway destinations.

**Electrical Engineer's Work in connection with Tramways.**

**420.** The work of the Chief Electrical Engineer in connection with tramways is dealt with in Part IV (*d*).

**Separation of Railways and Tramways not desirable.**

**421.** It appears to be the impression, from evidence tendered to us, that a separation of the tramways from the Railway Commissioners' control would be advantageous. We are unable to discover any sign of probable improvement in public service or in economy of operation by such a change of policy. The tramways to be of the greatest public benefit should, in addition to meeting transport needs within inner suburban limits, be complementary to the railways, working in conjunction with and relieving the trains of short-distance traffic where as good or better service can be given. Co-operation will be more than ever desirable when the suburban railways are electrified and the Harbour Bridge opened. Upon the side of economy the manufacture in railway workshops of various articles for tramway construction and maintenance, and the supply of power for railway requirements, as well as appliances of certain descriptions by electricity establishments now mainly engaged upon tramway work, enables both services to economise to a degree which only unified management and control could produce. We do not, therefore, recommend that the tramways should be divorced from the railways.

## VI.—MISCELLANEOUS QUESTIONS.

### Estate Department.

422. As indicated in the section dealing with organisation, one officer combines the duties of Estate Agent and General Manager of the Railway Refreshment-rooms. The responsibility of the Estate Agent for Railways and Tramways affects real estate, either vested in the Railway Commissioners or required for constructional work. This officer is also responsible for repairs and maintenance within the Metropolitan area. The value of the real estate, *i.e.*, the whole of the Commissioners' lands, including land for railways and tramways under construction (unimproved capital value) exceeds £4,000,000, and the value of letting properties, buildings only (improved capital value), is in the neighbourhood of £1,300,000.

423. The total annual rents from real estate collected on behalf of the Commissioners during the year 1923-24 was approximately £120,000, while the receipts from bookstalls and automatic machines was £9,000, these amounts, together with the allowance value of station-masters' and gatekeepers' free houses of £25,000, making a total of £154,000.

424. All assessments of municipalities and shires, as also water and sewerage authorities are dealt with by the Railway Estate Agent. The number of municipal and shire assessments dealt with equals 4,170 annually, and water and sewerage 700, the amounts paid for 1923-24 being £65,000 municipal and shire, and £14,500 water and sewerage.

425. The Estate Agent also deals with the clearance of sites rendered necessary on account of new construction work, and with claims for fires occasioned by the working of the railways or tramways, direct investigation covering liability and valuations being made by his branch. He also deals with land acquisitions on the basis of survey information supplied by the Engineer-in-Chief and deals with the settlement of land claims.

426. The branch appears to be administered along satisfactory lines, and we have no recommendations to make in this regard.

### Railway Refreshment-rooms.

427. Prior to 1916 the railway refreshment-rooms were leased to contractors, but with a view to general improvement in catering, the Commissioners, as leases fell in, took over the management of those then existing, and have since opened new rooms in various districts. We have inspected many of the refreshment-rooms, stores, kitchens, &c., and at both large and small places are satisfied with their administration. The prices charged are reasonable, the food supplied is good, the accommodation and equipment clean.

428. Certain evidence (Q. 3111) was tendered to us to the effect that the railway refreshment-rooms were not as satisfactory under present management as they were in the past, but from our own observations, and rebutting evidence (Q. 4079) received, we are not satisfied that the strictures passed upon the existing management are justified. It is difficult to cater for an intermittent and uncertain number of people, or at all times to exercise supervision over rooms at distant stations. There may on occasion be reason for complaint, and these the management is anxious to rectify. Under the conditions prevailing, we think that the provision of well-equipped accommodation at suitable places, together with good food at moderate prices, stands to the credit of the railway administration. Viewed from a business aspect, the taking over by the Commissioners of the railway refreshment-rooms has been advantageous, as the accumulated net profit after allowing for interest, maintenance and depreciation from the date on which the Department assumed control to 30th June, 1924, represents £223,673. For the financial year ended 30th June, 1924, the net profit was £23,069. Depreciation is charged at the rate of 2 per cent. on brick construction, 5 per cent. on board construction, and 7 per cent. for equipment,

Statistical

### Statistical Branch.

429. One officer combines the duties of Director of Statistics, Chairman of the Suggestions and Inventions Board, and Chief of the Advertising Branch. He is also head of the Australian Bureau of Statistics.

430. The Statistical Branch of the New South Wales Railways was established in 1919, when the compilation of statistical information for the various departments was centralised. The present staff numbers sixty-two, a considerable reduction having been made latterly on the introduction of additional mechanical appliances. Powers' tabulating and accounting machines were introduced in May, 1923, and eight months afterwards the whole of the stations in the service were brought under the system. The machines are now being used for compiling goods abstracts for all stations, inwards and outwards, revenue ton mileage, commodity statistics, and sectional earnings, monthly, and for the Commissioners' report. The general arrangement is for the whole of the figures relating to the previous month's working to be in the hands of the officers concerned by the 18th of the month.

### Advertising Branch.

431. This branch is responsible for the letting of advertisement spaces on railway and tramway property. The present number of contracts is 1,964. The display of advertising matter, the erection of hoardings, and the placing of railway and tramway advertisements in the newspapers is included in this section. All accounting work in connection with the advertising is done by the branch, audit being made by the Traffic Auditor and the Auditor-General. The canvassing is effected by the branch staff, commission not being paid to service agents.

### Australian Bureau of Statistics.

432. The Australian Bureau of Statistics was established in 1920 in order to secure uniformity in the compilation of comparative information relating to operating statistics, rates of pay and conditions of service, rates and fares and concessions allowed thereon. Quarterly and yearly bulletins of operating statistics are issued. Bulletins have also been issued referring to staff conditions and the rates of pay for each grade of employee, and the general conditions of carriage of all passenger, goods and livestock traffic. This cost of this Bureau is borne equally by the New South Wales, Victorian, South Australian, Western Australian, Commonwealth, and New Zealand Government Railways.

### Suggestions and Inventions Board.

433. The Suggestions and Inventions Board was established in 1915, with the object of interesting the staff in their particular work and remunerating them for any suggestions of proved value. The suggestions adopted to date number 4,154, and during the financial year ended 30th June, 1924, 853 were adopted, these representing an annual saving of £31,700. The cumulative saving since the inception of the scheme now amounts to over £500,000, after allowing for 5 per cent. depreciation in the value of each proposal in successive years. Added to this is the advantage arising from many devices which have been employed, affecting safe working and expeditious operation, the monetary value of which cannot be ascertained. A reciprocal arrangement exists between the various States of the Commonwealth, whereby devices of outstanding merit are interchanged and appropriate awards made by the State concerned.

434. This scheme of developing interest among the railway personnel is one adopted on a wide basis, and is wholly to be commended.

### Information and Publicity Work.

435. Information and publicity work is conducted by two officers attached to the office of the Chief Commissioner. The Information Officer acts as private secretary to the Chief Commissioner, and is in charge of the Bureau of Information, which, among other activities, disseminates information concerning railway operation in New South Wales to various railway administrations throughout the world.

436. The Publicity Department was established less than three years ago for the express purpose of dealing adequately on behalf of the Commissioners with reports or comments on railway matters. The Publicity Officer also controls the publication of "The Staff," a monthly magazine which is distributed free to the members of the railway and tramway personnel. The work of publicity is gradually being extended to embrace the active supervision of all departmental publications, and the preparation of announcements in various periodicals. The entire cost of the Department does not exceed £1,500 per annum.

437. In view of the increasing importance attached to an enlightened and informed public opinion, and the necessity for dealing with railway information and publicity along scientific lines, we are of opinion that both these departments are of considerable value and the expenditure involved in their administration is money well spent.

#### Medical.

438. In order to save time and cost, it would probably be found of advantage to have a medical officer attached to each Area Commissioner.

#### Appeals Board.

439. Our reference does not include staff matters, but as the question of drunkenness was mentioned in evidence we make this comment. A railway man engaged in traffic operation found drunk on duty is a danger to the public, his fellow-employees and himself. He is a criminal and should be treated as such. It remains to be said, however, that every opportunity should be given a man to disprove the charge made against him. If he is clearly guilty, then there should be no question of his retention in the railway service.

#### Railway and Tramway Institute.

440. The Railway Department has established a number of Railway and Tramway Institutes in various places. There are now forty-four branches and thirty-four sectional libraries. The membership of the Institute has increased to 23,733 during the year, 8,246 of this number being attached to the metropolitan institution. The expenditure for last year was £48,763, and the revenue from members' subscriptions and other sources amounted to £16,863. We consider this class of welfare work is very desirable, and would add that it is a practice extending very considerably in other parts of the world. We, have, therefore, no sympathy with those who urge that the expenditure by the Railway Department under this head is unwise. Apart from the advantages offered in regard to the education and training of the railway personnel, the social atmosphere engendered between the members of the Institute must have a good effect. Reasonable expenditure in this connection is, therefore, justifiable in view of the benefits secured by the staff.

441. The educational instruction is sufficient to take advanced students to the door of the University, but unfortunately there is not in Australia a Chair of Transport such as exists at some Universities. In England, in addition to University courses at Liverpool and Manchester, an Institute of Transport having within its scope all forms of transport, including the air, gives to students and, incidentally, to those advanced in years, every opportunity for keeping themselves in touch with the latest phases of transport science. Communication has been established between this Chartered Institute and the Railway and Tramway Institute. Some form of co-operation between these educational institutions is under consideration, and we hope this will bear fruit in the interests of the New South Wales Railway and Tramway employees.

#### Training of Railway Men.

442. For many years a reproach lay at the doors of railway management throughout the world that, while no expense was grudged in the purchase of improved machinery or new appliances, the human element responsible for the manipulation of the business for which such expensive machinery had been provided was left without facilities or even encouragement, if they cost money, to advance

advance in knowledge or add to experience beyond immediate local surroundings. Progressive administrations have latterly recognised that the man is at any rate equal to the machine as a desirable object in which to invest money with a view to the reduction of cost or greater efficiency of transport. Thus travelling as well as educational facilities, aided by reward where value could be shown, have taken the place of former indifference.

**443.** The Railway and Tramway Institute training, including competent instructors travelling with demonstration cars for teaching the Operating and Locomotive Staff, is excellent up to a point, but in order to give those who are anxious to advance in the railway service every opportunity and at the same time make certain that the good material which is evident in New South Wales is made of the greatest use to the State, we think that the scheme of practical education should be carried further by selection of those who specially qualify themselves in theory to be given work for a short time in each branch of the railway service, and later on be induced to study the railway systems of America, Great Britain, and the Continent of Europe, or alternatively, a tour in South Africa, and the Argentine, countries which are developing their railways rapidly and have many problems in common with New South Wales. We understand that some of the officers are given opportunities to study railway methods in other countries. It would be of advantage if all of them were in turn selected to visit the countries mentioned above.

#### **Public Evidence.**

**444.** The whole of the public evidence, as also the railway evidence, is given in the Appendix, and as will be seen from the former, several complaints regarding alleged railway failures are raised. While we have given consideration to all these pleadings, we have not dealt with the whole of them in our Report for the reason that there has evidently been misunderstanding as to all the circumstances surrounding some of these cases, and, in other instances, official papers have shown that the information upon which the evidence was given did not disclose the whole of the facts. The Chief Commissioner at Questions 3991-4356 referred in detail to these instances.

## VII.—SUMMARY OF RECOMMENDATIONS.

445. We give below a summary of our recommendations :—

### Finance.

1. That Railway Finance be taken out of the control of the Treasury and the Commissioners given full control of their own funds, and that the Commissioners be responsible for the renewal of loans on railway and tramway account and the raising of future capital.
2. That reserve funds be established to provide for obsolescence and wasting assets of permanent way and rolling-stock.
3. That the Railway Commissioners be recouped by the Treasury for losses incurred upon developmental lines during a period of ten years after they have been opened for traffic.
4. That the railways and tramways be so worked and managed that the gross receipts shall not be more than sufficient to cover working expenses, reserves, and interest on capital, including sinking funds. In the event of any surplus this be devoted to reductions of rates and fares, and in case of a deficit rates and fares be increased.
5. That a yearly balance-sheet, showing capital, revenue and net revenue, followed by departmental accounts in the usual company form, and a forecast of capital commitments for the following year, be rendered to the Legislative Assembly.

### Organisation.

6. That the composition of the Railway Commission be—(1) A Chief Railway Commissioner, (2) a Financial Assistant Commissioner, (3) a Power Assistant Commissioner, (4) a Tramway Assistant Commissioner, and (5) three Area Assistant Commissioners.
7. That upon the appointment of a Chief Commissioner by the Government it be left to him to select his own assistants.
8. That an area scheme of administration be introduced, and there be appointed three Area Assistant Commissioners, responsible to the Chief Commissioner and acting under regulations and instructions applicable to the system as a whole for operation, commercial matters and maintenance within their respective areas.
9. That the Engineering Branches, including Signalling and excepting the Department responsible for metropolitan railway construction, be merged under the control of the Chief Engineer.
10. That the Chief Accountant's responsibilities be enlarged, the work of the Traffic Auditor's Branch being merged in his Department, and that he assumes direct control over all the Branch Accountants.

### Construction.

11. That the completion of the City Railway and electrification of suburban lines be expedited as a matter of extreme urgency.
12. That new lines be constructed without interruption.

### Mechanical and Electrical Engineering.

13. That locomotive repairs, with the exception of those ordinarily connected with the running, be concentrated as soon as practicable at head-quarters.
14. That, as the average age of the existing stock of engines is very high, indicating a number of obsolete types, these be replaced as early as possible.
15. That a system of standard gauges be introduced in connection with locomotive maintenance and renewal.
16. That careful attention be given to the number of staff employed at Eveleigh.

**Mechanical and Electrical Engineering—continued.**

17. That early consideration be given to the standardization of the methods of loading coal into tenders.
18. That careful consideration be given to the question of coal consumption.
19. That the bulk of the work carried out at Honeysuckle Point, Newcastle, be transferred to Eveleigh or, alternatively, new works provided near Honeysuckle.
20. That six passenger and four goods engines be adopted as future locomotive standards.
21. That the carriage shops be removed to the new site at Chullora at the earliest possible date.
22. That the number of passenger vehicles be brought into line with the traffic requirements.
23. That replacement of old carriage stock be effected as speedily as possible, and the future standards arranged as recommended in the Report.
24. That improved purchasing arrangements in anticipation of requirements be introduced in connection with wagon stock.
25. That a new power-house be provided on the South Coast.
26. That the Cadet system of training officers in force in the Chief Electrical Engineer's Branch be extended to other branches.

**Operation.**

27. That control systems of railway traffic working be introduced.
28. That the lay-out both of passenger and goods accommodation at Newcastle be rearranged and early consideration given to the development of Broadmeadow as a through line station.
29. That improved train services be introduced on country branch lines, by rail motors or otherwise.
30. That sufficient rolling-stock be provided to meet public demands at all times, including times of drought.
31. That, in connection with live stock traffic, efforts be made to design a combined truck to combat drought supply difficulties.

**Commercial.**

32. That the fares charged for first and second class travel be reviewed.
33. That the difference between suburban and country fares be adjusted as soon as possible.
34. That until sufficient rolling-stock is provided to meet fully all requirements during periods of drought, reduced rates for fodder, under declaration and guarantee, be given in order to induce sheep and cattle owners to provide themselves with fodder during times of least railway traffic.

**Stores.**

35. That the reorganisation of the Stores Branch now in progress be expedited so that the whole of the stores be brought under the direct supervision of the Comptroller.
36. That stores be not subject to a charge for interest on loan account.

**General.**

37. That a graduated scheme of railway training be introduced.
38. That a programme of officers' visits to foreign railways be established.

446. In this Report, under the several headings, we make a number of suggestions which we consider should follow on the adoption of the above-mentioned recommendations.

## VIII.—CONCLUDING REMARKS.

447. In concluding our Report, we would express appreciation of the manner in which the Railway Commissioners and their officers have assisted us. A great deal of statistical and other information was necessary for the purpose of our investigation; this was collated and supplied with a promptitude that merits record.

448. Our thanks are also due to the official witnesses who gave us the benefit of their opinions, and also to the representatives of public bodies and associations who gave evidence before us.

449. We desire, in conclusion, to acknowledge the valuable work performed by our Secretariat—Messrs. Chas. Travis, J. A. Warren-King, and S. E. Fay.

Your Commissioners have the honor to be,

Your Excellency's Most Obedient Servants,

(Signed) SAM FAY,

Commissioner.

(Signed) VINCENT L. RAVEN,

Commissioner.

DATED at Sydney, this 3rd day of October, 1924.

## APPENDICES.

### Appendix I.

Sydney, 29th August, 1924.

I UNDERSTAND that evidence was recently given before you in connection with the preferential railway rates that locally manufactured galvanized-iron receives from the New South Wales Railway Department, and that a suggestion was made that this preference should be discontinued.

I should like to respectfully bring before this Commission the following points, which I think should be taken into consideration before any recommendation is made with regard to these freights.

1. The preferential railway rates on galvanized-iron have been in force for a very long period—nearly forty years, I believe—and presumably were originally granted to encourage the manufacture of galvanized-iron in New South Wales.

2. When the question of the erection of works for sheet-rolling and galvanizing at Newcastle was first considered by my principals in England, the fact that locally made galvanized-iron was carried at preferential rates by the New South Wales railways was taken into consideration, and was, in fact, a large factor in determining the directors of my English company to put down the works.

Had there been any suspicion in my mind that this preference would be taken away, or modified, I would not have recommended the erection of the works, nor, I think, would my English principals have committed themselves to the undertaking.

3. We do not add to the prices of our Newcastle iron any advantage we receive from this preference, our prices at Sydney being the same as those of our imported iron, and at the works 10s. below this price. It is the consumer who obtains the advantage, if any.

4. If we did not receive the preference we should be at an actual disadvantage in connection with 84 per cent. of the trade we do as compared with imported galvanized-iron, as, apart from the sale of our locally manufactured galvanized-iron in Newcastle and district (to which the question of railway freights does not apply) only 16 per cent. of our sales are made in the north and north-west of New South Wales, the remaining 84 per cent. being sold in Sydney or in the western, southern, and South Coast districts.

As regards Sydney, we have to sell in competition with imported iron, and to pay 14s. a ton freight from Newcastle, so that in this large centre we are actually at a disadvantage.

In connection with the Western, Southern, and South Coast lines our Newcastle iron has to be carried 100 miles further, so that the preference in freight only places it approximately on the same terms as imported iron, when the extra freight on this 100 miles is taken into consideration.

5. If the preference did not exist we should have to sell 84 per cent. of our products at approximately 15s. per ton under the price of imported iron to compensate purchasers for the freight they would have to pay on the extra 100 miles the iron has to be carried on the railways.

6. We have expended £400,000 on the works at Newcastle, and, in addition, £100,000 of working capital is employed in the venture. The works have been in existence for three years, and, so far, the undertaking has resulted in a loss of £26,000. For the last six months a net profit of £3,800 was made.

Our output at the present time is 16,000 tons of sheets a year, and it will be seen that, if we are to sell the iron at, say, 15s. a ton less, the result would be so unsatisfactory that it would be necessary to close down our works permanently.

We have, at the present time, four mills working, and three additional mills are in course of erection and will be completed before the end of the year. This will bring our output up to 25,000 tons a year, which practically represents the total requirements of New South Wales, and 25 per cent. of the requirements of Australia. When these new mills are running we shall be employing about 600 men at high wages, and, in addition, a similar number of men will be indirectly employed in the manufacture of the raw materials used by us, the whole of which are produced in Australia.

7. The bars we use are manufactured by the Broken Hill Proprietary Company, and a regular and increasing output of these bars is a valuable adjunct to their business, which I need hardly say is a vital one to Australia.

8. The preference on locally made galvanized-iron is not an isolated one, preferential railway rates being also given to other goods manufactured in Australia.

JOHN LYSAGHT (AUSTRALIA) LIMITED,  
A. R. LYSAGHT,  
Managing Director.

### Appendix II.

ANSWERS to Questions raised at the Legislative Assembly on 3rd October, 1923.

The two extracts from questions put to the Legislative Assembly on 3rd October, 1923, which had not been answered but which were handed over to us for consideration, have been carefully investigated, and our answers in connection therewith are set out below.

#### *Railway Locomotives, "K" Class Engines.*

Question No. 1.—Is it a fact that when an engine is ascending a grade the steam-chest pressure is almost, if not quite as great as the boiler pressure, and that therefore there is very little current of steam to carry the oil along the pipes?

Answer.—The pressure in the boiler is greater than in the steam-chest, and quite sufficient to carry the oil satisfactorily through the pipes at all times.

Question No. 2.—Is this the reason why it is important that the pipes should have a regular and continuous slope, so that the pipes "maintain a downward inclination when ascending the heaviest grade," so that the oil will flow along the pipes by gravitation to the steam-chest choke plug?

Answer.—The slope as shown on the designs submitted to us is sufficient to allow of a continual flow under any condition of gradient.

Question No. 3.—What is the value of a test on a stationary locomotive with no pressure in the steam chests?

Answer.—It is impossible to give an opinion on this unless accompanied by further particulars.

Question No. 4.—Were these pipes altered as suggested and recommended by the Board, and, if not, would the expense now being incurred have been avoided?

Answer.—We are informed that to the first part of this question the answer is "No," but no further expense has been incurred than would have been necessary had the suggestion been carried out.

Question No. 5.—Was the Board's recommendation that the pipes be altered made long before there were any complaints from drivers?

Answer.—There is not any direct evidence as to whether the drivers made their complaints before the recommendation or not.

#### *Automatic Railway Couplings.*

Question No. 1.—Were these couplings adopted in 1912; if so, how is it that only 9 per cent. of the goods stock and 11 per cent. of the passenger stock are fitted, and how long will it take to fit the remaining 90 per cent.?

Answer.—Yes. The percentages quoted are correct, and we are informed that they are not greater on account of funds not being available for further conversion.

Question

*Question No. 2.*—What proportion of the (a) goods stock, and (b) passenger stock, are fitted in the other States that are parties to the agreement?

*Answer.*—(a) It is understood that Victoria has only 100 goods vehicles fitted with automatic couplers. South Australia has placed orders for 1,100 vehicles to be fitted with automatic couplers. All vehicles on the Commonwealth railways are fitted.

(b) So far as is known no passenger stock is fitted in other States. All passenger vehicles on the Commonwealth lines are fitted.

*Question No. 3.*—Were 515 cases of goods trains parting, owing to these couplings jumping off the hooks, reported during the last financial year, although only 2,112 wagons are fitted; (a) how many such cases have occurred since they were first adopted; (b) what has been the cost of the accidents resulting from this cause; (c) is every case of a train parting whilst in motion likely to cause a serious accident; (d) what delays have occurred to trains owing to this cause?

*Answer.*—515 cases were reported. (a) The following cases have occurred since adoption:—

Year.	No. of cases.
1919.....	257
1920.....	305
1921.....	376
1922.....	515
1923.....	515
1924.....	400

We are informed that no records were maintained prior to 1919.

(b) We are advised that no expense has been incurred as the result of accidents from this cause.

(c) All these trains are fitted with the automatic brake, and any parting of the train applies the brake. Therefore, there should be no reason for a serious accident.

(d) We are informed that no record is kept of these details.

*Question No. 4.*—Does the cost quoted for automatic couplers for goods stock include the cost of the auxiliary chain coupling?

*Answer.*—We are informed that it does not.

*Question No. 5.*—Does the cost and weights quoted for automatic couplings and shackle and pin couplings include the cost and weight of the whole drawgear?

*Answer.*—We are informed that the cost and weight of the whole drawgear are not included.

*Question No. 6.*—Are these couplings on passenger stock only on close-coupled sets, and, if so, what necessity was there to fit them on 238 cars, when the object was "to arrive at the wear in traffic of the draw faces of the knuckle, the buffing faces and the knuckles, and the correct apportionment of the centre buffer resistance and resilience to take care of the draw-gear vibration and the brake decelerations"?

*Answer.*—Yes. Trials were made on thirty-two cars coupled into four trains, and after these trials were proved satisfactory further fitting of the vehicles continued. Two hundred and thirty-eight represents the number of cars fitted up to the end of September, 1923.

*Question No. 7.*—Is it a fact that this investigation was made on the first two or three sets fitted? (b) Was the wear of the draw faces found to be excessive? (c) Also the knuckles? (d) Was the draw-gear vibration, both when starting and stopping these trains, found to be excessive and very annoying to passengers? (e) Was it found to be impossible to prevent this jerking without putting on side or centre buffers?

*Answer.*—As stated, investigations were made on the first thirty-two cars. (b) We are advised that wear was not found to be excessive. (c) We are advised that knuckle wear was not excessive. (d) We are advised that jerks due to slack in the couplings did cause annoyance. (e) Diaphragm buffers are fitted to passenger vehicles, and appear successfully to overcome the trouble complained of.

*Question No. 8.*—What necessity was there to fit up about forty trains to arrive at the above conclusions?

*Answer.*—As stated, the forty trains were only fitted up after being satisfied with the trials made.

*Question No. 9.*—Is it claimed as the advantage of automatic over the shackle-and-pin coupling that it is not necessary for men to go between vehicles to attach or detach cars? (a) Is it necessary, or is it allowed, for employees to go between vehicles on close-coupled sets to attach or detach? (b) Are these sets ever uncoupled, except to effect repairs?

*Answer.*—No. Not in the transition stage, but finally it will be so claimed. (a) It is necessary for employees to go between vehicles on close-coupled sets to attach or detach, but this work is always done when vehicles are stationary, and invariably in the repair siding, where they are marshalled. Eventually this will not have to be done. (b) No, but when the electric service is inaugurated it will be necessary to split up the trains.

*Question No. 10.*—Even with automatic couplings, on either goods or passenger stock, is it necessary for men to go between vehicles to attach and detach the air hose?

*Answer.*—Yes.

*Question No. 11.*—Will further inquiries be made, say, from the medical officer *re* the number of accidents to shunters and others, owing to these couplings since first adopted?

*Answer.*—We are informed that during the past ten years there have been only five cases of slight injury sustained by employees for which the automatic coupling could be held responsible.

*Question No. 12.*—Was it proved by actual experience when suburban sets were run without buffers that the jerking was excessive, both when starting and stopping, although the engine was tight-coupled to the train? Will he ascertain whether it would be better to make proper tests now, before any further expense is incurred, with a passenger train, fitted complete, including the engine, with automatic couplings, and no side or centre buffers?

*Answer.*—As already stated in answer to No. 7, it has been decided to adopt diaphragm buffers, which appear to get over the trouble complained of.

*Question No. 13.*—What reliable results can be obtained as to what the wear will be of the knuckles, knuckle faces, and buffing faces, when they are in use after the transition period, by testing them on close-coupled sets with side or centre buffers? Is the amount of movement on these parts the same when they are tight-coupled on side or centre buffers as when running free with only the automatic coupling?

*Answer.*—These results were obtained under such conditions on the first four trains. The amount of sliding movement, which is the movement which causes wear, is the same with or without buffers.

*Question No. 14.*—Are these couplings in use on railways in Great Britain?

*Answer.*—These automatic couplers are in use in Great Britain.

*Question No. 15.*—Is it a fact that experts who have travelled in America, where these automatic couplings are in use, state that the jolting and jarring is excessive, and would not be tolerated by passenger travellers in New South Wales?

*Answer.*—We have not heard of any such statement.

Appendix III.

LIST OF WITNESSES EXAMINED.

Name.	Designation.
Hartigan, T. J. ....	Chief Accountant, New South Wales Government Railways.
Coghlan, F. A. ....	Auditor-General, New South Wales Government.
Spencer Watts, J. ....	Messrs. Smith and Johnson, Public Accountants, Sydney.
Fraser, J. ....	Chief Railway Commissioner, New South Wales Government Railways.
Cann, The Hon. J. H. ....	Assistant Railway Commissioner, " "
Fox, H. ....	Assistant Railway Commissioner, " "
Denneen, W. H. ....	Traffic Auditor, " "
Hunt, P. S. ....	Estate Agent and R.R.R. Manager " "
Byles, C. B. ....	Signal Engineer, " "
Hodgson, C. A. ....	Chief Traffic Manager, " "
Ranken, R. L. ....	Engineer-in-Chief for Existing Lines, " "
Garside, F. C. ....	Comptroller of Stores, " "
Carroll, W. ....	Director of Statistics and Advertising, " "
Crouch, T. ....	Publicity Officer. " "
Spence, J. ....	Director of Finance, New South Wales Government.
Brain, O.W. ....	Chief Electrical Engineer for Railways and Tramways, New South Government Railways.
Hutchinson, W. ....	Engineer-in-Chief for Railway Construction, New South Wales Government Railways.
Bradfield, Dr. J. J. C. ....	Engineer-in-Chief, Metropolitan Railway Construction, New South Wales Government Railways.
Sheldon, Sir Mark ....	President, Sydney Chamber of Commerce.
Atwill, R. H. S. ....	Superintendent, Passenger Transportation, New South Wales Government Railways.
Quinton, W. C. ....	Superintendent of Goods and Livestock Transportation, New South Wales Government Railways.
Kater, Hon. Dr. N., M.L.C. ...	President, Graziers' Association of New South Wales.
Thorby, H. V., M.L.A. ....	President, Farmers and Settlers' Association of New South Wales.
Lucy, E. E. ....	Chief Mechanical Engineer, New South Wales Government Railways.
Kidd, James ....	Vice-Chairman, Central Council, Producers' Association.
Binnie, Charles ....	President, Stock Owners' Association of New South Wales.
Love, J. C. ....	Ex-President, Associated Chambers of Manufactures of Australia.
Newlands, S. F. ....	Senior Vice-President, Chamber of Manufactures, New South Wales.
Waite, W. A. F. ....	Councillor, Chamber of Manufactures, New South Wales.
Herrod, E. E. ....	General Secretary of the Fruit Growers' Association of New South Wales.
Rothwell, W. ....	President, Metropolitan Retail Fuel and Produce Merchants' Association.
Edwards, A. C. ....	Secretary, Metropolitan Retail Fuel and Produce Merchants' Association.
Rumford, J. B. ....	President, Sydney Section, Australian Association of British Manufacturers and their Representatives.
Clark, Rupert ....	Australian Association of British Manufacturers and their Representatives.
Huie, A. G. ....	Secretary, Free Trade and Land Values League.
Edwards, Frank L. ....	Secretary, Motor Traders' Association, also representing National Roads and Motorists' Association.
Bragg, J. S. ....	Lithgow Coal Association.
Herring, A. E. ....	Apple and Pear Growers' Association.
Kilgour, R. G. ....	Mayor of Newcastle.
Trebeck, J. B. ....	Rutherford, Mayfield-Homeville, Telarah Progress Associations.
Gamble, J. H. ....	Mayor of Hamilton.
Neal, S. M. ....	Mayor of Wallsend.
Griffiths, A. ....	Waratah Council.
Lightfoot, J. C. ....	Lambton Council.
Paton, John ....	Newcastle Chamber of Commerce.
Weyland, E. G. ....	Southern Coalowners' Agency and Southern Colliery Proprietors' Association.
Macdonald, C. M. ....	Northern Collieries Association.
Mechan, W. ....	Locomotive Running Superintendent, New South Wales Government Railways.
Williams, F. J. ....	Senior Outdoor Assistant to the Chief Traffic Manager.
Mulheron, D. ....	Outdoor Assistant to the Chief Traffic Manager.
Milne, E. S. ....	Outdoor Assistant to the Chief Traffic Manager.
Sievers, E. J. ....	Valuer General.
Doran, E. J. ....	Tramways Traffic Manager.
Cowdery, G. R. ....	Engineer for Tramways.
Goode, C. J. ....	Goods Superintendent, New South Wales Government Railways.
Morris, W. J. ....	Secretary, New South Wales Government Railways.

## ROYAL COMMISSION ON RAILWAYS AND TRAMWAYS.

FIRST DAY.

MONDAY, 2 JUNE, 1924.

(The Commission sat in the Chief Secretary's Building, Macquarie-street, Sydney.)

COMMISSIONERS:

Sir SAM FAY.

Sir VINCENT L. RAVEN.

THOMAS JOSEPH HARTIGAN, Chief Accountant, New South Wales Government Railways and Tramways, examined as under:—

1. Sir SAM FAY: We should like to ask you one or two questions on your statement which you have sent in in reply to questions we gave you.

*Answers by Chief Accountant to Questions submitted by Royal Commission.*

*Q. An outline of the existing system of accounting is desired?*

A. The system of accounting in the department is controlled by the Chief Accountant, and a balance is effected monthly. That officer in the first instance, decides how all expenditure shall be debited in the accounts, i.e., whether the debit is to capital, revenue, or other account. Each of the main spending branches, viz., per-way, locomotive, traffic, signalling, electrical and refreshment rooms, has its own accountant who is responsible for the preparation of its monthly accounts, which are submitted to the Chief Accountant. Outside the branches mentioned all the accounting work is done by the Chief Accountant.

All expenditure, whether for wages, salaries, miscellaneous payments, or materials passes through the books of the Chief Accountant.

In each of the above-mentioned branches the accountant is responsible for the proper appropriation of all expenditure; and such appropriation is advised to the Chief Accountant fortnightly in the case of wages and salaries, and monthly for the materials used by the branch. As the accounts pass through the books of the Chief Accountant they are debited in accordance with such appropriation.

At the end of each month a balance statement is submitted to the Chief Accountant by each of these branches—the balance statement for the remaining branches being prepared by the chief accountant—showing on the debit side the gross expenditure for the month under the head of wages, salaries, miscellaneous, materials, and including the total charges by other branches less any cash credits for sales, &c. On the credit side is shown the appropriation of the expenditure as between the various accounts, together with charges to other branches.

The Chief Accountant compares the expenditure with that disclosed in his cash books, and effects a balance before proceeding to make up from such statement the monthly accounts for submission to the Commissioners.

All work performed for outside persons is cleared in the branch books by debiting an account known as personal account and crediting working expenses. The outstanding accounts are thus transferred to the books of the Chief Accountant, who is responsible for collection and clearance.

As regards the earnings, these are under the control of an officer known as the Traffic Auditor. Each of the stations on the system at which there is an officer-in-charge is required to furnish a monthly account to the

Traffic Auditor showing his transactions during the month. From these accounts the earnings, which represent the debits in the station books, are compiled.

All receipts from stations are remitted daily to the Chief Cashier in Sydney. This officer is under the control of the Chief Accountant, and is responsible for the banking of the cash daily. A reconciliation is made each month by the Chief Accountant between the actual receipts and the monthly balance statement of earnings as submitted by the Traffic Auditor.

All accounts are kept on the double-entry system; and the books kept by the Chief Accountant comprise the usual books of accounts—expenditure cash book, receipt cash book, journal, capital ledger, principal ledger, together with other subsidiary books necessary to properly carry on the business.

*Q. Is the capital actual or estimated?*

A. The capital represents the actual cost expended on the construction and equipment of the existing lines of railway.

*Q. Does the interest on capital represent the actual rate at which moneys for railway purposes was raised?*

A. No. The interest is calculated on the capital invested at the average rate of interest paid on the whole of the State department. The Railway Commissioners are advised of this rate by the Treasury, but have no means of checking the correctness thereof. Attached will be found two statements marked "A" and "B" respectively, showing:—

(a) "The approximate interest charges that would have been debited to the Railway and Tramway Services in the year ended 30th June, 1923: by taking the average rate of interest payable at the 30th June, 1913, on the capital expended at that date, after allowing for that portion of the capital that was renewed subsequent to that year and prior to the 30th June, 1923, each subsequent years' interest being charged on the railway and tramway capital expended at the average rate paid on the net amount of loans raised by the Government for the requirements of the whole of the State, and adding interest charges on the difference in the average rate of renewals of loans raised in 1914 and 1915."

(b) "The approximate interest charges that would have been debited to the Railway and Tramway Services in the year ended 30th June, 1923: by taking the average rate of interest payable at the 30th June, 1913, on the capital expended at that date, each subsequent year's interest being charged on the Railway and Tramway capital expended at the average rate paid on the net amount of loans raised by the Government for the requirements of the whole State."

*Q. Who prepares the yearly estimates for submission to the Treasury, and if the Chief Accountant, what is the procedure?*

A. The annual estimates are prepared by the Chief Accountant from information furnished by each branch of the service. They are then submitted to the Chief

Witness—T. J. Hartigan, 2 June, 1924.

Commissioner, who, after detailed examination of the figures, reduces the estimate to the minimum requirements of the service.

Q. If there is any yearly record of "wasting" assets, the particulars would be appreciated?

A. No record is kept of "wasting" assets. All renewals are met out of the current year's revenue.

Q. Is there any subdivision in the accounts between maintenance and renewal? If so, give particulars?

A. The classification of working expenses accounts—copies of which have already been forwarded—only provide for renewal of the track being kept separately, but renewals of rolling-stock are also separated in the accounts. All other renewals are included with maintenance.

Q. Information is desired as to the appropriations from revenue for capital purposes during the last ten years?

A. The only appropriation by Parliament from revenue for capital purposes during the last ten years was £7,991.

It is, however, pointed out that no portion of the re-railing, re-sleepering, or re-ballasting work is debited to capital account, the whole cost being borne from revenue. Other works costing £100 or under which might properly be debited to capital account are charged to the working expenses of the year in which the cost is incurred.

The total annual cost of these works which are defrayed from working expenses, but which could be correctly charged to capital, is between £70,000 and £80,000 per annum.

A.—Interest Payable on Capital Invested in Railways and Tramways.

STATEMENT showing approximate interest that would have been paid on Capital Invested in Railways and Tramways for the year ended 30th June, 1923, if interest had been calculated on the average rate of loans raised year by year since 30th June, 1913, allowing for interest on capital invested at 30th June, 1913, being at the average rate paid by the State less loans renewed within the period, interest on which is calculated at the average rate of loans raised for such renewals.

Year.	Railways.		Tramways.	
	Capital Expended. Amount.	Interest. Rate. Amount.	Capital Expended. Amount.	Interest. Amount.
1913.....	£ 57,653,778	per cent. £	£ 6,699,305	£

Acts No. 5 and 31 of 1914 renewed ...	6,682,000	†1.38381 92,466	1,234,000	17,076
Act 14 of 1915 renewed .....	3,000,000	†.67927 20,378	.....	...
		4,062,626		498,204
Interest charged at average rate, viz., £5 3s. 3d. per cent. ...	...	...	4,487,303	500,274
Excess Interest paid ...	...	...	£424,677	£2,070

\*Interest calculated on Railways, £2,057,833, and Tramways £235,820. (Capital invested only.)

† Acts Nos. 5 and 31 of 1914 and No. 14 of 1915 were included as raised in 1914 and 1915 respectively, and were renewed during the period, the rates charged, viz., 1.38381 and .67927 represent the difference between the respective average rates. Other loans were also renewed, but the difference in rate and amount raised for Railway or Tramway purposes would not make any appreciable difference.

B.—New South Wales Government Railways and Tramways.

STATEMENT showing the approximate interest charges that would have been debitable to the Railway and Tramway Services on the basis of the capital expended at the 30th June, 1913, calculated at the average rate of interest payable at that date, and on the capital expended each year from 1914 to 1923 at the average rate of interest paid on the net amount of the Loans raised by the State each year covering that period.

Year ended.	Capital Expended		Interest Charges.		Interest rate on basis shown above.

* Interest charges actually debited the Railway and Tramway services in the year, 1923					4,487,303 500,274
Increase					913,185 111,162

NOTE.—The interest charges in 1923 have been calculated on the capital invested only in that year, viz., railways £2,057,833, tramways £235,820.

2. Your office is in the city?—Yes, in Pitt-street.

3. Have you any offices outside that?—Yes, one at the Central Railway Station. The chief cashier is located there. He receives all the money despatched from the stations.

4. But the whole of your accounting work is done in the office in the city?—Yes, it is finalised there.

5. Has that had any influence on the organisation of your department—having the office away from the Central Station?—It is certainly by no means convenient; it would be far better to have the accounts centralised in the one building.

6. Closer contact would simplify the accounting?—Yes, in the sense that in the preparation of figures it is now necessary to be continually telephoning for detailed information. If there was centralisation somewhat similar to that existing in Victoria it would do away with all that.

7. You say that the balance is prepared monthly?—Yes.

8. What date in the following month do you make the balance?—About the 16th.

9. About the middle of the following month?—Yes.

10. In your first answer here you say that you decide how expenditure is to be debited?—Yes.

11. Is that in a general instruction, or detailed?—After works are submitted by the engineers to the Commissioners, and approved, I am the first officer to whom papers are sent. On those papers I direct how the charge is to be made. They are then sent to the branch concerned. Details are kept in my office of the particular works. As I receive from each branch a detailed expenditure on its accounts each month, there is no possibility of any account being debited without authority.

12. And the branch accountants carry out your instructions?—Quite so.

13. I see you have a traffic accountant. What is there in the traffic department, apart from wages, necessitating an accountant?—He is called an accountant, but his work in this respect simply consists in making a balance-sheet for the traffic accounts, including miscellaneous services and the issue of materials to the branch, such as uniforms, and so on.

14. As a matter of fact, there is very little apart from wages and salaries?—Very little; he really only makes up these accounts, but has other work in addition.

15. Are the departmental accountants under your jurisdiction?—They are, in a sense; in relation to any matters of account they always take my advising, but, properly speaking, they are under the control of the head of the branch, and responsible to him and not to me.

16. Do you check it at all?—Yes, a check is occasionally made from my office, but as a general rule we accept the appropriations as shown on their balance-sheet and the details accompany them as rendered to me each month.

17. You have nothing to do with the way in which they deal with the department in the shape of statistics?—No.

18. That is entirely a matter in the hands of the heads of the departments?—That is so.

19. You say, in the second paragraph of your answer, that all expenditure passes through your books. Am I right in assuming that that is in gross?—Yes, in gross.

20. You do not repeat the figures of the branch accountants?—No, only in so far as relates to any miscellaneous vouchers for services which may have been rendered by outside parties. These are made up by the branches, and are passed through my books, but the wages, salaries, and materials are only given in gross totals.

21. You say any outstanding accounts there are at the end of the month are transferred to your books?—That is so. If a branch carries out a work in the workshops or elsewhere for an outside party, whatever charges are incurred during the month the branch will credit its working expenses and debit the amount to the parties concerned. This debit is then transferred to my books at the end of the month, and I then arrange for its collection. By this method the branch has no further bother with it, and it centralises the outstandings in the books of my office.

22. He furnishes the account to you, and that is an end of it?—Yes, that is so. The outstanding balances are collected by me.

23. Then, with regard to earnings, you have got a Traffic Auditor who is responsible for that particular part of the work?—Yes.

24. Is he responsible to you in any way?—No, he is not under my control at all; he is an independent head of a branch directly responsible to the Commissioners.

25. How do you effect payments—by cheques?—Yes, excepting wages and salaries. We pay the great bulk of our wages in cash, by means of pay clerks who travel all over the lines. They take the cash with them from Sydney or cash cheques at various centres in the country, as may be found more convenient.

26. You draw a cheque on the wages in bulk?—Several cheques are drawn.

27. Who signs the cheque?—The Chief Paymaster. All cheques, except those drawn on certain advance accounts, are issued from my office and counter-signed by my assistant, or, in his absence, the Head Book-keeper.

28. For stores, too?—Yes, just the same.

29. Do you sign them personally?—No.

30. They are signed by your paymaster under you?—Yes.

31. One signature only?—No, all cheques are counter-signed by the Assistant Chief Accountant, or, in his absence, by the Head Book-keeper.

32. Your assistant being responsible for the amount?—Quite so. Before an account is paid I authorise its payment; without my authorising signature on it no cheque would be drawn. It is not authorised until checked by the Examiner.

33. All accounts are kept on the double-entry system?—Yes.

34. You do not repeat the branch details?—No, except as regards the schedules of working expenses account, from which the annual report figures are compiled.

35. As to the question of capital, you say that capital represents the actual cost expended on construction and equipment. Was that so from the inception of the New South Wales Railways?—Yes, as far as I am aware.

36. It is absolutely accurate from the start?—Yes, as far as my service in the department enables me to say.

37. Then we come to the question of interest on capital. You say the interest is calculated on the capital invested on the average rate of interest paid on the whole of the State debt, and that the Commissioners are advised by the Treasurer what it is, but you have no means of checking the amount. You know what loans they raise?—Yes, but the trouble is we do not know how the actual interest paid is distributed. There is not only interest on the loans raised, but also the interest on the over-drafts at the Bank, and I have never been able to ascertain how the average rate is computed. The Treasury advises us of the average rate, but I personally doubt whether that rate is correct. It is questionable whether we are not being over-charged by too high a rate.

38. The Railway Department is responsible for 50 per cent. of the total State debt?—That is so.

39. I do not know whether I ought to ask you this question, but do not answer it if you think you should not. Can you reconcile the figures given in your published account with the public debt as shown in the statistics issued by the Government Statistician?—I have never tried to do it with that figure, but a reconciliation is annually made between the capital account as shown in the public accounts made up by the Treasury and those published in the Commissioners' annual report.

40. The difference amounts to many millions?—Yes, it does.

41. I am talking of the total debt of the State?—Yes.

42. In the public figures it gives Railways and Tramways £106,000,000, while in your report you give as money spent £99,000,000. There is a difference of £7,000,000—that is a lot of money?—Yes. I do not know where they get that figure from.

43. Perhaps I ought to put this to the Treasury?—I could possibly find it out for you. It is only a question of ascertaining where the figures were obtained.

44. Here is your publication actually with an expenditure of £99,000,000?—Yes, and while we do not publish a reconciliation of the capital with the Treasury accounts, we do so with the working expenses and revenue: this statement shows the reconciliation of the published accounts of the Treasury compared with our figures. This is required owing to the Treasury accounts being on a cash basis.

45. That does not affect the capital?—No. At the same time subsequent to the publication of the Commissioners' report we make a reconciliation to a penny of the capital between our figures and the Treasury figures.

46. If you will be kind enough to send that also I would be glad?—I shall be only too pleased.

47. It would save us bothering our heads about figures which may be perfectly correct?—You may take it that our figures are unassailable.

(The Chief Accountant subsequently furnished a statement explaining the difference in the capital account of the Railways and Tramways as published in the Commissioners' annual report for the year ended 30th June, 1923, and that shown in the "Statesmen's Year Book, 1923, p. 72.")

The difference is accounted for by the figures in the Statesmen's Year Book, including capital expended on lines under construction which is not debited to Railway and Tramway capital account until such time as the lines are opened up to public traffic.

Reference to the Auditor-General's report, with the published accounts for 1922-23, p. 68, will show a balanced reconciliation with the figures published in the Commissioners' annual report for that year. The figures, it might be pointed out, exclude capital provided from consolidated revenue.)

48. I will not ask you questions about the two statements we have put in now, because I would like to get

Witness—T. J. Hartigan, 2 June, 1924.

those figures absolutely settled first—the difference between your figures and the figures published by the State, showing the public debt?—I will get those.

49. Estimates which are sent forward to the Treasury are prepared by you in the first instance?—Yes.

50. From information sent direct to you by the heads of the departments?—Yes. Each head sends a statement of his detailed expenditure.

51. Expenditure on capital and revenue?—Yes, both accounts. I then analyse the figures before submitting them to the Chief Commissioner, who deals with them personally. He gives them a thorough overhaul. I have known him to cut them down by a million.

52. On capital account?—No, on revenue account, but the capital account is also severely dealt with as well.

53. The heads of departments send to you in the first instance their proposals with regard to capital expenditure?—Yes, in detail, except the Way and Works Branch. This branch does not give details, but simply outlines its requirements under such headings as “duplications,” “additions,” &c. The loan requirements are then summarised and taken to the Chief Commissioner, who goes through them, and, guided by the necessities of the department and the labour available, generally cuts down the figures considerably. The amended figures are then forwarded to the Treasury.

54. I suppose it is simply a matter of convenience sending it to you in the first instance?—Hardly so, as it is necessary to have the whole of the proposals summarised.

55. With regard to capital, do they give you details?—All except the Way and Works Branch. This branch simply states its proposed expenditure under various heads. There are, however, large numbers of works in progress, of which I have a record, and the expenditure on these and on proposed new works is provided for.

56. Sir VINCENT RAVEN: The locomotive department is the biggest spending department in the railway?—Yes.

57. Do I understand that the estimate of what they require to spend, both capital and revenue, during the ensuing year, is sent direct to you?—Yes.

58. Without any consultation with the Chief Commissioner?—Yes.

59. The Chief Mechanical Engineer does not first talk the matter over with the Chief Commissioner and then send to you?—No.

60. It goes to the Chief Commissioner afterwards, and he pulls it to pieces and it is altered?—Yes.

61. That, I presume, is in consultation and agreement with the head of the department?—No, the head of the branch is not consulted. The head of a branch very often has visions of spending a great deal more money than the Chief Commissioner thinks is desirable or necessary. He probably considers he is going to run a great many more engine miles than the Chief Commissioner considers warranted by existing conditions. On the Chief Commissioner's knowledge of the railway requirements and the anticipations of the forthcoming season, he bases the expenditure. He has his previous experience as a guide, and is seldom far out when the final results are realised.

62. Would he not have a good idea of the work he is supposed to do in the ensuing year?—Yes, he should have, but, as previously pointed out, the head of a branch often takes a rather ambitious view in respect to his anticipated spending.

63. Would he not consult the Chief Commissioner?—He could not do so.

64. Would that not be the proper course to pursue if he had any doubt?—Not necessarily, because his view and the Chief Commissioner's view might be very different, and his suggested requirements come under close review subsequently.

65. The Chief Commissioner's decision is final?—Yes, and the Chief Commissioner has to keep within his estimates. It is a very difficult thing getting money from the

Treasurer in excess of the estimate at the end of the financial year. For the last three or four years we have had no occasion to make such a request to the Treasurer.

66. Any further questions on that would be better put to the Chief Mechanical Engineer himself?—That would be for you to say.

67. I understand you to say that you have the deciding as to whether the money should be appropriated to capital or revenue?—Yes, that is the charge—not the money itself. I say how the debit for the work should be allocated.

68. Whether it is a capital account authorised by the Commissioners or whether it is not a capital account?—That is so.

69. But you do not decide what should be put to capital and what to revenue?—I do, in this way: if a work is authorised by the Commissioners to enlarge a station building, which may displace £500 or £1,000 portion of the existing building, I say how much of that new work is to be debited to capital and how much to revenue.

70. But no expenditure is to be charged to capital account unless it is in connection with the work authorised by the Commissioners?—That is so.

71. And you have no power to go beyond that, except to decide what shall be charged under that ruling?—That is so. It boils down to this fact, that the allocation of the debit for any particular work is in my hands.

72. I suppose if the Commissioner did not agree with that he could raise the point?—He could, but he does not generally do so. The Commissioner might think as a matter of policy certain work should be charged to working expenses, and if so he would mark that on the papers.

73. He might raise it?—Yes, he would do that at the initial stage.

74. And if you wanted to alter the methods of keeping accounts in any other department or revise the methods in any way you would send instructions through the head of the department and not directly to the accountant attached to that branch?—No, I always communicate with the head of the branch unless it is perhaps a matter of some minor kind.

75. Sir SAM FAY: All renewals you say are made out of current revenue?—Yes.

76. There is no cash reserve to meet renewals?—That is so.

77. Coming to wasting assets: I suppose you have no record of any sort as to what the waste assets may amount to?—Not the slightest.

78. Who keeps the record of the age of the engines, for instance, and the permanent way?—They are kept by the respective branches—the permanent way and the Chief Mechanical Engineer.

79. You have no knowledge of that?—No, I have a stock-book in which is recorded the stock of locomotives and rolling stock generally, which enables me to keep track of the capital stock and also follow any condemnations which may be made.

80. You say that renewals of rolling stock and of the tracks are kept separate in accordance with the classification expenses, works, account?—Yes.

81. Can you show me where you have it in any public statement?—It is not shown there. We publish the cost of relaying separately, but we keep in our own books the cost of repairs as distinct from renewals. About three years ago we used to publish the costs separately, but since then it has been discontinued in accordance with the revised classification of working expenses account.

82. Is it published by the Statistician in any way?—No, he would not have the information.

83. But you do separate them in your books?—Yes.

84. You were asked as to the appropriation from revenue for capital purposes during the last ten years, and I see you say only £7,000?—That is all; that was a direct appropriation by Parliament in connection principally with some small work at Port Kembla and resumption of land at Swan Park.

85. Was that taken from surplus revenue?—Yes.

86. You have a small works account?—Yes, up to £100.

87. Are those sanctioned by the Commissioner before they are commenced?—Yes.

88. The departmental officers get permission to spend up to £100 on a particular work before they do it?—Yes. A work under £10 can be carried out without sanction.

89. It amounts to about £1,500 a week?—Yes. The great bulk of that would be works approved by the Commissioners before they were actually commenced.

90. But you decide how it should be dealt with—or does it automatically go?—It goes through my office just the same.

91. You keep track of that small expenditure as well?—Yes, but the branches keep the details.

92. Sir VINCENT RAVEN: On page 15 of this report a figure is shown of the amount expended on construction and equipment, which is rather different from the figure shown on page 25 showing the authorised capital provided for railways. It rather looks as if you spent rather more than you ought to have. The figure in the one case is £89,276,000, and in the other case £89,488,000?—In the one case the amount is capital that the Government provided us with on the Loan Act, and we did not spend it all. The actual capital spent was the smaller sum.

93. I suppose the balance is carried on to the next year?—It used to be, but conditions have changed in the past three or four years. At one time we could carry the credit balance forward to the next year, but now the balances are closed automatically on the 30th June and cannot be used until permission is obtained from the Treasurer to expend further sums.

94. If you have more money than you can really spend; it does not look as if you had any difficulty in getting enough money?—As a matter of fact, it depends very largely upon the Government. The estimates are not passed as a rule until somewhere about half-way through the financial year. We are in a state of doubt during the early months as to what money is likely to be provided. Even when the estimates are passed there is no guarantee that the money provided for in the Loan Act will be available. It all depends upon the Government's ability to raise money to the extent authorised by the Loan Act. If it cannot be provided, naturally the Commissioners have to curtail their loan programme. We are entirely in the hands of the Government.

95. But my point was that in the report you show you have not spent all the money authorised. If that is so, it is hardly consistent to assume that you find it difficult to get enough money to spend?—The reason why it looks inconsistent is because of what I have stated. You would not see the apparent inconsistency if the Railway Commissioners knew definitely that they would get the whole of

the money asked for. The Loan Act authorises the Government to raise certain money. It does not provide the money, and if it is not available, naturally it is quite impossible for the Commissioners to spend it.

96. It is only a fictitious statement, and means nothing?—That is so, excepting that we have to assume it will be available until advised to the contrary.

97. It might easily be a million?—Quite easily. The reason the figure is shown is because of the adoption of a uniform form of balance-sheet by the various States. The figures shown by the other States may be actual cash provided by the Government. Ours would be a supposititious sum. It is a figure and a figure only.

98. The Chief Mechanical Engineer may find it very difficult to keep his rolling stock up as it should be if he cannot get the money to do it?—Yes.

99. And it is quite possible from what you say that he may be refused the money that he considers necessary?—Quite possible, and it has been so. The Commissioners are absolutely in the hands of the Government as to what money they can get. They can ask, but what they ask for and what they get are often two different things. It depends, no doubt, on the Government's ability to provide funds for the whole of the State's loan requirements.

100. And that applies to the permanent way department as well?—To everyone.

101. Of course, it is more important to the people who have to keep up the rolling stock and the railway as it should be kept?—Undoubtedly. That is one of the troubles our railway administration is faced with. I do not suppose we are any exception to any other State, but the position is as stated with the Government controlling the money. We have no control over our funds. Every penny we collect is paid into the Treasury each day. We can only get money from the Treasury, and if the Treasury is pressed, our position is likewise.

102. Sir SAM FAY: Is the position that all the moneys you take you pay over every day to the Treasury and you cannot get it out again unless it coincides with your estimates?—Yes.

103. And even then it may be refused on revenue account?—Quite so. It has happened in the past.

104. So that any expenditure that any head of a branch may have got authority from the Chief Commissioner to expend during the year for necessary upkeep of his department may be some time or other refused?—It is quite possible.

105. Solely because the money which you receive from the public for conveyance has been paid to the Treasury, and you have no means of getting it out again, although you might be making a profit of 5 per cent. on the railways?—That is the position.

(Sitting concluded.)

SECOND DAY.

THURSDAY, 26 JUNE, 1924.

(Held at Chief Secretary's Building, Macquarie-street, Sydney.)

COMMISSIONERS :

Sir SAM FAY.

Sir VINCENT L. RAVEN.

FREDERICK ALBERT COGHLAN, Auditor-General, sworn, and examined, as under:—

106. Sir SAM FAY: We should like to ask you for a little information as to how far you go in your audit of the railway accounts? I take it that you audit the accounts more particularly to see that the votes upon it are carried in accordance with the vote itself? Do you go beyond that to any great extent?—That is so. That is what we call an appropriation audit. In anticipation of your asking that question I have prepared a statement of the appropriation audit and the inspection and expenditure audit. As to the appropriation audit, the vouchers are of two classes—(1) payments passed through the Treasury, and (2) adjustments of advances direct from Railway Department. These classes are again divided under the following accounts:—Consolidated revenue, general loan, special deposits, and public works. The examination of the above-mentioned vouchers is conducted in accordance with section 45 of the Audit Act, 1902. (a) Compare the entries in the Treasury cash sheet with the supporting vouchers and documents sent therewith, also with the bank sheet; verify all vouchers into the Treasury appropriation ledgers. Section 45 of the Audit Act provides for a departmental audit, putting the Railway Commissioners on the same footing as the departments.

107. Do you go beyond the chief accountant's department? Do you go into the departmental accounts?—Yes, I only paused to indicate the nature of section 45, and I am coming to that other matter. This is still the appropriation audit. (b) Ascertain whether such vouchers and documents bear upon the face of them a correct description of the proper heads of receipt or expenditure to which moneys mentioned therein have been credited or debited. (c) Ascertain whether the moneys mentioned in the vouchers have been credited or debited to the proper heads of receipt or expenditure. (d) Ascertain whether such moneys were legally available for and applicable to the services or purposes to which the same have been applied or charged. (e) Ascertain whether the provisions of the Constitution Act, this Act (the Audit Act), or any other Act, and the regulations have been in all respects complied with.

107A. Then there is the expenditure audit. *Salaries, wages, and pensions.* Examination—test one month in three as to certificate, authority, acquittances, and repayments. Registration—salaries, test 600 salaries yearly. (Double and over payments.) Pensions, refunds, &c., test one month in twelve and all broken periods. Contingencies. Examination—continuous check as to authority, acquittance, castings, extensions, &c., including payments made abroad; also examination of minute papers. Receipts returned (rebates, &c.)—detailed examination from minute papers, &c., of rebates on carriage of store and starving stock, wheat, flour, &c., as per railway by-laws. *Contracts*—same as general contingencies as to examination, &c., with addition of special attention as to rates and authority as under—annual contracts. Checking the rates of all purchases made under the annual contracts arranged by the Comptroller of Stores as per annual schedules. *Railway construction.*—Checking the rates charged for all purchases and charges in connection with railway construction work. The Commissioners' approval in each case is seen and noted in a book kept in this office. *Railway refreshment rooms.*—Inspecting contracts arranged by the

general manager and checking all payments made there under. *Special contracts.*—A large number of contracts are arranged for the purchase of rolling-stock, locomotives, machinery, sleepers, &c., details of which are kept in a special book at the railway accounts branch; the entries made therein are checked with the papers. Afterwards, every payment made is registered whether in London or Sydney. A large number of "not in contract" purchases are made, such as for steel rails, iron, &c., which entail numerous payments before completion. These are also entered in the contract book for convenience, and each payment is registered. Generally, the Commissioners' approval is seen for all "not in contract" purchases of £100 and over, compensation for goods lost, damaged, or destroyed, £25 and over and over, bonuses to employees, £20 and over. Registration (double payments and over-payments and verification of posting). Test, three months in each year; inspect minute papers in special cases, such as compensation for resumption claims. The vouchers are filed in this department and held for three years, and then forwarded to the Treasury for storage for four years, when they are destroyed, with the exception of salary or wages sheets, &c., which are returned to the Railway Department quarterly on completion of examination.

107B. Then there are railway stations and tramway depots. The accounts of the railway stations in the metropolitan district are inspected from time to time by inspectors of this department, which practically divides the year with the railway staff inspections, and gives a half-yearly examination which is very essential in railway accounts. The accounts of the most important stations in the country districts, embracing all the towns where other Government accounts are conducted, are inspected annually, except at such stations which have been inspected by railway staff immediately prior to inspections of this department in same towns. The inspection includes the balancing of cash and accounts at the moment of inspection, the examination of all the account books, and subsidiary books of debit, the checking closely of ledger accounts for freight on credit, the sighting of goods on hand for which freight is unpaid, the examination and testing of stocks of tickets, checking rates for passengers and freight, and closely examining into the methods of debiting miscellaneous revenue such as storage, demurrage, &c. *Railway Accounts—Head Office.*—An annual inspection is made at the Chief Accountant's office of both the receipts and expenditure for railways and tramways. A considerable amount of cash is received by the Chief Accountant, apart from the bulk of revenue collected by the stations. The receipt butts are checked into the cash book, and thence to revenue as at other departments. The outstanding accounts are specially examined. Fixed deposit receipts or other securities are sighted and checked with records. The Chief Accountant, at the last inspection of his accounts, held unadjusted advances amounting to £2,380,436. The first object of inspection is to balance the account and to reconcile it with the bank account. The lines followed are generally on the lines adopted in other departments, by the production of cash and vouchers unrecouped, and the bank pass-book. The methods of accounting are closely inquired into, and the accounts are subjected to a close scrutiny. *General Balance Statements.*—Balance statements for both railways and tramways revenue are attached. These are audited by officers

of the Inspection Branch. The gross revenue for the year 1922-23 is shown as railways £15,328,344, and tramways £3,529,000. *Other Railway Accounts.*—These include such as the Railway and Tramway Institute and its country branches, Railway Superannuation Fund, the Superintendent of Tramways, and other branches of this large department. They are subjected to an annual audit.

108. Sir SAM FAY: Then you do not go below the Chief Accountant really, except so far as the station receipts are concerned?—That is so.

109. The stores department, for instance?—No. I get a statement of the stores which are published in their report, but I make the department responsible for that statement.

110. The Commissioners audit their own departmental accounts themselves?—Yes.

111. You do not go into the manufacturing side at all, I suppose, in the locomotive department, in the shops where they manufacture?—No.

112. Do you audit the accounts in connection with the new line construction?—Only as regards the expenditure—not in any detail. When I say that, I am speaking, of course, on the supposition that you will allow me to put in the expenditure statement. That will show that particular examination.

113. There are no reserves shown in the accounts for any wasting assets on the railways?—No. The railway accounts here are not conducted on that plan. Under the Railway Act all receipts have to be paid into the consolidated revenue.

114. Paid in daily?—Yes.

115. I think you are acquainted with the railway accounts of the Union of South Africa, are you not?—I know something. I have not been to South Africa, but I have read with interest the Auditor-General's reports. They are very full indeed, and the system there is probably known to you. I only mentioned just now that all the Commissioners' receipts were paid into the consolidated revenue. In South Africa they are paid into a harbours and railway fund. The Union Act provides that there shall be a Harbours and Railways Fund. I think there some steamships owned by the harbour authorities which are carried into that, but, roughly, the railway receipts would be about £20,000,000, and their expenditure slightly less. The rest of the expenditure is made up of the various utilities the board have, and their revenue runs into over £22,000,000. The law there provides that all moneys shall be paid into the Railways and Harbours Fund, and that all other revenues of the Crown shall be paid into the consolidated revenue fund. The only way in which that could be done here, of course, would be by an amendment of the Constitution Act, the Railway Act, the Audit Act, and so on, and it is really a matter of policy for the Treasurer and the Government. Of course, it is practicable if you get the legislation. It is practicable without having the harbour connection at all. You could have, say, a No. 1 consolidated revenue account and a No. 2 consolidated revenue account, which would be really a railway account. The expenditure side in South Africa is appropriated by Parliament practically on the lines of the appropriation here, except that they have a number of funds which the Railway Commissioners have not got here. For example, they have sleeper plantations in anticipation of their needs. They have various funds, a sick fund and a number of things that we have not got, but it all hinges on the fact that we have a consolidated revenue fund, and only a consolidated revenue fund. They have a consolidated revenue fund and a railways and harbours fund.

116. Looking at it from an accountant's point of view, or from an ordinary business point of view, you have got a big wasting asset in the railways. It is always going on. Directly a locomotive is put into service it begins to waste. The time comes when it must be renewed, and

here there is no reserve. In South Africa they have got it?—That is a special feature in South Africa. For example, to the best of my recollection, in the last report I saw—I think 1922-23—the renewals fund stood at about £4,000,000.

116A. It was pretty high, yes. From your experience of the audit of the accounts generally, are you of opinion that it would be an advantage here?—I think decidedly that would be an advantage.

116B. That is assuming that legislation is carried through?—As I said before, the legislation is a matter of policy, but, looking at it from an ordinary business point of view, the Commissioners would be in a much better position in managing their asset, and the public would be in a better position by the creation of such a legislative arrangement. Of course, speaking of the railway and harbours fund of South Africa, we could achieve the same result by a separation of the two contributories to the consolidated revenue fund. You know, of course, that when there is a surplus in railways it goes to the consolidated revenue and is absorbed. Of course, if the Railway Commissioners want that money the appropriation must be approved by the Government and voted by Parliament.

117. Do you look into the question of the non-paying lines at all?—Not specially. I drew attention to the fact that very considerable loss is occasioned by commencing lines under the Norton Griffiths contract, and then abandoning them. I pointed out the loss of interest on the arrangement that had been made, by the sudden cessation of work on those lines.

118. It was not that that I was thinking about so much as the loss on the lines after they were actually constructed?—I think that really is hardly an Auditor-General's function. He has not got the expert information which the Commissioners have. Many factors might enter into a loss on a line which the Auditor-General here could not go into. He has not got the staff. In Japan the Auditor-General has expert engineers, doctors, architects, and all sorts of people, but I do not believe in that system, because if you have an expert set aside for a department like the Auditor-General, who has not got that necessary knowledge, that expert is likely to deteriorate. I would not advocate that plan here, but its absence prevents the Auditor-General commenting on things which the public might perhaps think he ought to comment on.

119. You come in contact with the Chief Accountant's Department pretty well every day, I suppose, or your people do?—Frequently.

120. Do you think it would be an advantage for the Chief Accountant to be responsible for all the accounts, departmental as well as the principal accounting office?—I think so. I think that you would have a better control, and it would be more satisfactory to the Commissioners and other people concerned if that were so.

121. Sir VINCENT RAVEN: Would that mean a great increase in staff?—I do not think so.

122. It would mean an increase?—It would mean an increase, but just at the moment I would not like to express an opinion on the organisation necessary. It would certainly mean some addition.

123. In connection with separating the railway and harbour account like it is done in South Africa, has not something of the same kind been done with the Water Board here?—I have seen it announced in the press, as the intention of the Government, but I have not any official knowledge of it, only press notices have appeared.

124. It is not in existence?—The Metropolitan Water Supply and Sewerage Board is really on the same footing as the Railway Commissioners. There is a little difference in regard to interest on works on the construction which in the case of the railways are capitalised and the railways take over the work when it is finished. That did not apply to the Water Board. It is hardly necessary to go into that, I think. You asked me the intention in regard to the Water Board. It was announced in the press that

Witnesses—F. A. Coghlan, 26 June, and J. W. Watts, 28 June, 1924.

the Government intend to make a new Water Board and that the Water Board will be practically self-contained. If it has a surplus, that will be used by the Board.

125. At any rate, they are considering that?—Apparently so. When the Parliament meets on 1st July, of course the opening speech will show the measures that the Government intend to submit.

126. Sir SAM FAY: There are two or three other, not public works, but businesses?—Business undertakings.

126A. Are they dealt with in the same way as the railways, or have they got their separate accounts?—They are dealt with in the same way as the railways. The Harbour Trust was for some years differently treated. They paid a fixed 4 per cent. as the rate of interest chargeable on their loans, and when the interest rate—what is called the average rate of interest—soared over the 4 per cent., the Government passed legislation altering that fixed 4 per cent., but earlier than that the Harbour Trust were really paying more than the Government were paying on the loans they were raising or had raised.

127. How about the brickworks; do they keep their accounts in the same way?—That is really a business undertaking, although it is called an industrial undertaking, because it is established under what is called the Special Deposit Industrial Undertakings Act. It is a skeleton Act, and there is an amendment Act which allows the profits to be disposed of by the Minister, but these are self-contained industries. Some of them are small. The brickworks are a big thing now, but at its initiation it was a very small matter. The brickworks get advances from the Government, and they are so run that they demand cash for orders and they deliver a very good product. Last year all the capital indebtedness had been repaid and a big profit in addition; the State has now really a running concern, making bricks, which is free of all cost to the community. In the case of an industrial undertaking there is a special deposit account opened for the industrial undertaking. In 1911 a number of industrial undertakings were established—the metal quarries, brickworks, and so on. They commenced to trade and all their operations were carried on in the special deposit account.

128. A separate account altogether?—Yes. It is a very large feature of the Treasurer's accounts here, where all sorts of funds are kept in what is called the special deposit account. The Government make an advance for an industrial undertaking. That is carried to the special deposit account. The industry commences to operate on that, and Parliament has nothing whatever to do with that industrial undertaking once it is established. It pays a sinking fund of—I am not sure of the fraction, it is less than 1 per cent.—and the profits can be paid into consolidated revenue if the Minister elects so to do, or they can be used in the business. They are generally used in the business, and all the operations of that business, as

long as it is successful, are simply under the review of the Minister. Parliament does not interfere at all. It does not appropriate any moneys other than what might come along in loan votes for that particular undertaking. That is all that Parliament has to do with that industrial undertaking. It does not, as in the case of the Railway Commissioners, receive the revenues; neither does it appropriate the funds, which will be the expenditure. The whole industrial undertaking is conducted by the manager as manager and by the Minister concerned as director, that is, practically standing in the relation of the director of a company. In examining the position of the industrial undertakings, you treat them on commercial lines, as far as Government usages allow. You charge them everything. If they occupy Government land, you charge them for it. If they occupy a Government building, they are charged rent, and so on, and in all respects, other than the payment of land and income tax and directors' fees, they are practically the same as an ordinary business. The brickworks you refer to are an example of success. There are some others like the Monier pipes industry and the metal quarries. The Monier pipes industry is the exploitation of a series of patents, and the metal industry—what we call metal, it is basalt which is used for road construction, it is in the native quarry, and it is Government land—you have got to sell it to make your profits. The material from which the bricks are made are on Government land. The brickworks are charged the cost of those lands. Of course, they have been depreciated by the quarries they have made. What they call the industrial undertakings and the business undertakings are really all businesses, but run under different statutes, and the industrial undertaking is a self-contained business which is subject really to the personal factor of the skill and ability of the manager. The Minister takes a hand, but really the manager is the man who makes it a success or otherwise. We have had some notable instances of that where a manager not having the necessary knowledge has done a lot of things which a man who had the necessary knowledge would not have done, and that industry went on the rocks.

129. Sir VINCENT RAVEN: The Railway Commissioners own a coal mine, do they not?—Yes.

130. Is that entirely for the use of the railway and under the Railway Commissioners?—I would not be prepared to say that. I do not know the actual practice of the Commissioners in regard to that. I do not think there is any restriction on the Commissioners if they wish to trade.

131. Is the cost of that charged to the railway?—That would go into the railway account.

132. They get the entire advantage of it, if there is an advantage in having it?—I understand so. I do not know of the conditions on which it is established.

Witness retired.

(The Commission then adjourned.)

### THIRD DAY.

SATURDAY, 28 JUNE, 1924.

(Held at Chief Secretary's Building, Macquarie-street, Sydney.)

### COMMISSIONERS :

Sir SAM FAY.

Sir VINCENT L. RAVEN.

J. WEBSTER WATTS (Messrs. Smith and Johnson, Public Accountants), sworn, and examined:—

133. Sir SAM FAY: I understand that your firm, Frederick J. Smith & Johnson, public accountants, made a report to the Commissioners on financial matters in 1921?—Yes.

134. We should like to ask you one or two questions with regard to certain aspects of those accounts to which we

have given some attention, that is, the question of the absence of any reserve or renewal. We notice that at page 19 of your report you did to some extent deal with it, and apparently came to the conclusion that it would be a proper thing to have such a reserve, provided it was under the control of the Commissioners?—That is so.

135. Do you still think that that is the right thing?—I think it is the only way. Of course, it is very necessary

to equalise the charge for renewals, and it seems to me the only way to do it is to form a reserve fund. What I was, and am still, afraid of is that if there were stringent times the Government might use the fund so created. If it were definitely under the control of the Commissioners there would be no such possibility.

136. I do not know if you are acquainted with the accounts of the Union of South Africa?—No.

137. There they have a fund?—Yes, I know that, and I think their reserve is £3,000,000 or more.

138. They have had that method of account-keeping from the date of the union?—Yes.

139. Generally speaking, I believe the fund is used for extensions of railways, but the State undertakes to find the money for renewals when it is required for that purpose?—That really is not a renewal reserve, but a reserve for extensions. In New South Wales, of course, they have a very small reserve fund; at least, it sometimes amounts to that. The existing practice is to estimate the charge for repairs and renewals for the coming year, and obtain sanction for spending the amount estimated. The expenditure as incurred is then charged to working expenses, but should the work not progress as rapidly as anticipated, provision is made in a suspense account for the whole or part of the unexpended balance of the estimate. This in itself comprises a reserve on a small scale.

140. That is a reserve that does not provide for the wasting asset?—No, it equalises the charge possibly between two years. That is the only effect it has, so that really it is nothing.

141. Looking at it from the strict accounting point of view, of course, the accounts do not quite disclose the position?—They are not in the balance-sheet year by year, and that is what I have pointed out. The nett results of the various years are not correctly shown. It is clear that although the asset has been rendering the same service year by year, yet the previous years which should, strictly speaking, have borne an equal part of the charge for renewals, have borne no part at all. The surplus of those particular years have therefore to this extent been overstated, and consequently the surplus of the year of renewal will be understated. This defect should, in my opinion, be remedied by providing a repairs and renewals reserve fund. The existing practice is to estimate the charge for repairs and renewals for the coming year, and obtain sanction for spending the amount estimated. I have already said why we have not adopted the above suggestion, for fear that the Government might use the fund so created.

142. And when it was wanted it would not be there?—That is so.

143. Would it not be rather difficult for a Government to say, "We have a reserve fund in our hands, accumulated by the Railway Administration, but we are unable to produce the money when they want it for the purposes of renewal"?—It is not for me to say.

144. But it would be very awkward?—Yes, though I think they do it sometimes.

145. We know nothing about politics out here, and are only looking at it from a purely railway point of view, and when we find that it is done in the Union of South Africa, and being advocated very strongly for the whole of the railways of India, where they have got into very serious trouble in consequence of having no reserve, we rather come to the conclusion that there ought to be a reserve here, and I gather that you are of the opinion that there should be a reserve, provided it could be ear-marked and made available?—Yes, in my opinion the problem of reserve for renewals can only be satisfactorily dealt with if such fund is absolutely under the control of the Commissioners.

146. That means that the whole of the finance would be under the control of the Commissioners?—I should think so. They would arrange their loans and it might be said that they would save interest, though I do not know that.

147. If they have an adequate reserve there would be no more difficulty in their raising money than there is in the case of independent railway companies?—That is so.

148. That is rather treading on a political tail, which we do not want to do. We should be glad to hear from you how you think it should be done?—Provided the reserve should be under the control of the Commissioners, I think the wasting assets should be divided into groups, and an estimate made of the utility lives of the assets comprising such groups. Having obtained this table, it would be a matter of calculation to find out the amount which would be properly allocable against profits. This amount would approximate a certain percentage of the total assets and this percentage could be taken as a basis for the following year.

149. By the percentage of total assets you mean the capital cost?—Yes. It would be necessary to revise this percentage from year to year, as the totals comprising the respective groups would naturally vary. Apart from this, there is the question of obsolescence and supersession, and I think in addition to the depreciation reserve adequate provision should be made for the replacement and renewal of assets which may become obsolete or may be superseded before the expiry of the expected utility lives of such assets. As to what should be considered an adequate reserve in this regard will be difficult to determine.

150. Sir VINCENT RAVEN: Would you not calculate the depreciation and renewals on a life basis?—Yes, but in addition to that there is the question of supersession and obsolescence, which would arise in case the assets were disposed of or superseded during the utility of such assets. It would mean that it had not been written off during this life, and therefore there would be a balance to reserve against. The additional reserve would only be necessary as an equalising medium for losses which are likely to occur in respect of the disposal of assets which have not been fully depreciated; that is, which have become obsolescent or have been superseded before the expiration of their estimated utility lives. Possibly one way of dealing with the matter would be to take into consideration the likelihood of obsolescence and supersession of assets when estimating the utility lives of the assets, that is, make an estimate on a somewhat conservative basis, thus automatically increasing the yearly allowance charge against depreciation.

151. I think they are rather more likely to over-live their life than to die too early?—Yes; if they electrify or do anything of that kind it may possibly be the reverse.

152. At some future stage it may be, but at the present moment they have plenty of old machines to put on one side?—Yes. When I was investigating in 1921 I noticed that the assets were not grouped particularly well.

153. Sir SAM FAY: I notice they have carried out some of your suggestions, the major portion of them regarding the accounts being all on a similar basis throughout Australia?—Yes. Of course, I think they would be well-advised to keep records of the principal capital assets, giving particulars of the cost of such assets, and also an idea as to the condition. It does not appear to be sufficient indication of the actual position to show that there are so many engines, so many waggons, &c., unless the proportion or number in good, indifferent, or bad condition is also stated. It appears to us, as being important, that the condition of the equipment should be periodically brought under review in order that there should be no undue continuance of deterioration of capital assets without adequate renewal. In any case, I think it desirable that proper records should be kept of each group of assets or of each class of assets in such groups; otherwise it would seem to be almost impossible to accurately gauge the renewal requirements.

154. Sir VINCENT RAVEN: I think that would be represented by their life?—Yes, but you would want them sufficiently grouped to find out what percentage to take off.

Witnesses—J. W. Watts, 28 June, and J. Fraser, 4 July, 1924.

The various assets would have different utility lives. My meaning was that they had not grouped the assets sufficiently.

155. Sir SAM FAY: Do you mean as between engines and carriages and waggon and so on?—Yes, it appeared to be in 1921, but I cannot say whether it has been improved since then. There is one other point that I would like to bring up. When investigating the affairs of the New South Wales railways in 1921, I found that certain expenditure had been met out of revenue, and included in working expenses, which might properly have been charged to capital, and I took this fact into consideration when reviewing the adequacy of the charge for repairs and renewals. I found, moreover, that all the expenditure on renewals of permanent way had been charged against working expenses, although in my opinion it would have been quite fair to charge capital account with the cost of the excess of the original weight of the rails replaced. I also found that work chargeable to capital account performed in the shops—although charged with a proportion of shop charges—was not charged with a proportion of over-head expenses. I was satisfied that not only did revenue bear all the cost of repairs and renewals, but bore also certain charges which might fairly have been debited to capital. I took all those matters into consideration in considering whether the charge for repairs and renewals had been sufficient.

156. Sir VINCENT RAVEN: That really means that you would never put any betterment to revenue? It is

quite a common thing to put in heavier rails and charge it to revenue or even a larger locomotive and charge it to revenue?—I must not express any opinion against yours, but that is what I consider from a strict accounting point of view. Actually during the war years, though the bill for repairs was heavy, renewals of locomotives, tenders, carriages, waggon, and the like were few. During the war period it was well-nigh impossible to procure certain parts requisite for the replacing of new and up-to-date rolling-stock on the lines, and naturally the maintenance cost of the then existing rolling-stock was proportionately heavier. I considered at the time, when abnormally high prices were ruling, the Commissioners were well advised to maintain their existing stock and concentrate on better loading methods and increasing the hours run, rather than renew the stock unless absolutely necessary. Doubtless, however, the position has now changed and possibly somewhat extensive renewals will be necessary. It is a pity that some years ago we did not commence this renewal reserve and so equalise the charge that will have to be borne now and during the next two or three years.

157. Sir SAM FAY: Of course, that meant that the work not done during the war years when they could not get material had to be done at a later period, for which no provision whatever was made during those years when it was not done?—Exactly, and that is where they will feel the need of a reserve during the next few years.

(The Commission adjourned.)

#### FOURTH DAY.

FRIDAY, 4 JULY, 1924.

(Held at Chief Secretary's Building, Macquarie-street, Sydney.)

#### COMMISSIONERS:

Sir SAM FAY.

Sir VINCENT L. RAVEN.

JAMES FRASER, Chief Railway Commissioner, sworn, and examined:—

158. Sir SAM FAY: The only questions we want to ask you this morning are in reference to the memorandum you sent us, replying to six questions we have put.

*Q. Estimates of expenditure on loan and revenue account?*

A. In this connection, under the provision of the Government Railways Act, 1912, section 13: "All moneys appropriated by Parliament for the maintenance or management of the railways, shall be expended under the control and management of the Commissioners. To enable the necessary appropriations to be made, estimates of expenditure on loan and revenue account are furnished annually through the Minister for Railways to the State Treasurer, as provided for under Section 40 (b) of the Railways Act, and on Parliamentary authority being obtained for such expenditure, the State Treasurer may make provision to meet departmental requirements up to the total which may have been allocated by Parliament to the separate accounts. It should, however, be stated that departmental estimates of expenditure required, both on loan and revenue accounts, have been generally greater than the amounts which the Government has been able to provide, and the expenditure in both connections has therefore been restricted to essential requirements.

*Q. Method of dealing with deficits or surpluses on year's working?*

A. When there has been a deficit on the year's working, such deficit has had to be made good by the State Treasurer out of consolidated revenue. When there have

been surpluses on the year's transactions, such surpluses are kept by the Treasury and absorbed in the consolidated revenue.

*Q. Method of dealing with receipts?*

A. Provision is made for dealing with receipts under Section 14 of the Government Railways Act, 1912, which provides that "all moneys payable to the Commissioners, under this or any other Act, shall be collected and received by them on account of and shall be paid into the consolidated revenue."

*Q. Expenditure on renewal account, and the absence of any reserves to meet wasting assets?*

A. All essential renewals are carried out from year to year, and the expenditure so incurred is debited against the working expenses of that period. No reserves have so far been established to meet wasting assets.

*Q. The organisation of the Chief Accountant's Department and the departmental accountants?*

A. The departmental practice has been up to the present time to have an accountant associated with the head of each department. This course has been necessary, owing to the fact that the various departmental offices are scattered over a very wide area, and as it is essential that the heads of departments should be able at any moment to obtain information as to expenditure in any particular direction or on any specific work, the accounts of each department have been kept more or less under the direct control of the head of the department to facilitate the economic conduct of his business. If it had been practicable to house the whole of the departments under one roof, it would have been possible to place the Chief Accountant in actual control of the

whole of the accounts of the service. The major control, however, in this connection is still in the Chief Accountant's Branch, as all accounts are finally assembled and dealt with in that branch.

*Q. The system of dealing with estimates of the departmental officers as between yourself and those officers and yourself and the Treasury?*

*A.* Heads of departments are directed to submit annually their estimate of expenditure for the ensuing financial year. These estimates are furnished in the first instance direct to the Chief Accountant, who, as soon after their receipt as possible, sees me personally with the estimates, and I either approve of same or modify them to such extent as I may personally consider it necessary to harmonise with my own views as to what it is possible or practicable to expend in relation to the revenue likely to be received, and the interest which must be met during the year in question. The estimates as approved or amended are then forwarded to the Treasury, and if not agreeable to the State Treasurer and his officers further discussion takes place as between the Treasury officials and myself with the object of endeavouring to harmonise our estimates with those which the Treasurer himself submits to Parliament, in association with all other Government departments, in his financial statement for the whole of the financial year.

159. We would like to have a little more information on the details. Commencing with No. 1, as to expenditure on loan and revenue account, do we understand that revenue expenditure on the upkeep of the line and rolling-stock has been withheld on account of financial stringency as well as capital expenditure on new works and lines?—It has been varied on occasions.

160. Due entirely to the conditions of the State finances?—In the endeavour to balance the expenditure with the total revenue.

161. Has that been the case of recent years?—It is the case, I think, almost every year.

162. Does that mean that your estimates are reduced at the start, or that you are pressed at some period during the later part of the year to reduce the expenditure?—Oh, no, not in the later period. Before the estimates are submitted to Parliament the State Treasurer quite naturally endeavours to have his estimates prepared on such a basis that he can show that he is going to make ends meet.

163. That is the whole of the departments in the State, including the railways?—Yes. As our estimates form at least one half of the total expenditure incurred by the State, our estimates, of course, loom rather largely in the Treasurer's financial statement.

164. That would naturally be so, because the expenditure upon railways in the State is a little more than half the total receipts received by the Government in any year.—Yes.

165. That is, receipts from general taxation?—Receipts from other sources—land revenue, and so forth—provide the other half of the total receipts which form the consolidated revenue of the State.

166. The mileage of the railways has been very largely increased during your term of commissionership?—Yes. It has been a period of considerable progress in connection with railway construction.

167. Apart from the cost of constructing the new lines, have you been able to obtain sufficient loan capital to efficiently equip these new lines with rolling stock?—No, we have not.

168. Railways are taxed, I believe, to some extent by municipalities and others?—Shire councils, yes. Railway lands throughout the whole of the State, except the metropolitan area, have to take the same taxation as private lands in the same areas.

169. Amounting altogether, as far as we can see, to £80,000 a year?—For the moment, yes. That is an expanding burden.

170. Under the Railways Act of 1912 the Commissioners were to be reimbursed for loss either by way of expenditure or loss of revenue consequent on any system on a matter of policy directed by Parliament. Have you ever claimed anything under that head?—Very little. We have made claims and we have received payment, but only as applied to emergency transactions. In one or two cases the whole State has been devastated by serious drought conditions, and the Government has indicated to us its desire that fodder and starving stock should be carried at a nominal rate throughout the State. We have had fodder carried, for instance, from any point to any point at a rate of 10s. per truck load. Under a direction of that kind from the Government, the Government would reimburse us the difference between that 10s. per truck and our own concession rate for the carriage of fodder and starving stock.

171. Of course, looking at the clause in the Act as it stands, it looks as if it was intended to meet a case of a new line imposed upon you which you knew could not pay its working expenses?—I do not think that that was the intention of the framers of the Act.

172. What was the idea?—The idea, I think, was to meet certain transactions of the kind that I have just mentioned.

173. Of course, that does not take you very far?—It does not take us very far.

174. It looks, on the face of it, a great deal wider?—Yes.

175. Has a question of a separate budget for railways ever been considered?—It has been talked of, but never seriously.

176. It has never been put to the Government?—Never been put up to any Government.

177. Coming to No. 2, "When there has been a deficit on the year's working, that deficit has been made up by the State Treasurer out of consolidated revenue." I suppose you mean there, when you speak of a deficit, not only the cost of working, but the interest?—Payment of the interest cost, yes.

178. You have never been short of actual working costs?—Oh, no.

179. And your interest payments have increased, so far as your published accounts are concerned, so far as they show, as between 1914 and 1923, by over one and a quarter millions per annum?—Yes, that is, in interest rate.

180. And not increased capital?—Oh, yes, but it has increased by more than one and a quarter millions if you take the increased capital into consideration as well. The total interest bill has increased by over two millions.

181. I am afraid I have not got the correct figure?—Two and one-third millions, roughly, the total interest payable.

182. With over one and a quarter millions?—That is, increase of the interest rate.

183. As between 1914 and 1923 it has gone up £1,297,000 a year?—Yes.

184. That you have got to find by some means or another out of the railways?—Yes.

185. More than was so in 1914?—More than was so in 1914.

186. And this is in addition to the interest on capital expended since that date on new lines?—Yes.

187. How much do you say that amounts to?—Slightly over an additional million pounds.

188. That is two and a quarter millions?—£2,364,249 is the total increase in the interest charges. The actual increased percentage as between 1914 and 1923 was 111·36 in the interest bill.

189. Have the surpluses during the time you have been Commissioner been sufficient to wipe out any deficit in the interest?—No, not during our period from 1917. That is,

Witness—J. Fraser, 4 July, 1924.

taking the period of the present administration, from January, 1917, to the end of 1923, the surpluses we have had have been less than the deficit which we have had in the aggregate.

190. I suppose your deficits were during the war years?—During the war years, a period of low productivity in the State, and a period of poor business.

191. No. 3, "Method of dealing with receipts"—you have no cash at all in your possession from day to day?—The cash passes out of our possession the moment it is paid into the State Treasurer's account at the bank.

192. With regard to expenditure under renewal account, and in the absence of any reserve to meet wasting assets, you say that all essential renewals are carried out from year to year. Would you explain exactly what you mean by an essential renewal?—I mean that it is our province, in the first instance—it is our duty to the public—to carry on our transportation services with safety. That is essential, and any expenditure that may be necessary to ensure the safety of the travelling public must be incurred.

193. When you speak of essential renewals, you do not mean, do you, that you are renewing anything on the basis of life of line or rolling stock?—On the basis of condition, not necessarily on the basis of life. Life is a governing condition, of course, in connection with certain things, but in connection with other matters life is not necessarily a governing condition.

194. Does it not really mean, when you say here, "all essential renewals," that you are referring to adequate maintenance and not renewal?—It just depends on the interpretation of the word "essential"—essential from the point of view of safety, essential from the point of view of comfort, or essential from the point of view of aesthetic appearance. Certain things are essential from the point of view of safety, and any expenditure that may be required to secure safety must be incurred.

195. That rather goes to a definition of what is a renewal and what is a maintenance. You can keep your lines safe and you can keep your rolling-stock going by adequate maintenance, but that is rather a different thing from renewals?—No, you cannot by adequate maintenance. You must renew certain parts of a permanent-way, you must renew certain parts of a bridge, you must renew certain parts of a building, or on any rolling-stock that is used you must renew certain parts to ensure that the permanent-way, the track, the bridges, and the buildings shall be in a safe and reasonably satisfactory condition from year to year.

196. Would you rather call that ordinary maintenance?—That is ordinary maintenance. Renewals, of course, are necessary from other points of view.

197. Sir VINCENT RAVEN: If you are renewing a girder of a bridge, that would only be maintenance, would it not?—That is maintenance.

198. If you are renewing a fire-box of a locomotive, that would be maintenance?—That is so.

199. Not renewal?—No.

200. Sir SAM FAY: Looking at No. 5, "Organisation of your Chief Accountant's Department," the staff you have there appears to be very weak in numbers for a Chief Accountant's office if they are to do anything really essential in the way of audit of the big accounts you have got. They do not apparently verify the branch accountant's figures, at all, do they?—They do not make any very serious attempt to verify the accounts submitted by the various branches because the various accountants in the various branches are deemed to be competent to submit, and they do submit as a matter of fact, correct accounts with regard to the work which is done in those branches.

201. Take your stores department. He does not audit that at all?—He does not. The Traffic Auditor does. The Traffic Auditor sends members of his staff over there to check up certain sections of the stores. He does not check up everything that is controlled or every item that is under

the charge of the Comptroller of Stores, but he does make a certain check every year of the stores that are under the control of the Comptroller of Stores.

202. Is the Traffic Auditor responsible for checking any other branch accounts?—No, not branch accounts.

203. The Traffic Auditor's principal duty is the checking of the station accounts, revenue?—Yes, traffic accounts and also refreshment-rooms and advertising.

204. The Auditor-General does not audit any of the branch accounts?—No.

205. He takes the figures from the Chief Accountant's Department?—Yes.

206. Coming to No. 6, "System of dealing with estimates," I understand that you modify the estimates from spending departments and that you consider, amongst other things, the possibility of the revenue in the ensuing year?—Yes.

207. And it is based on that, and what you consider the departments themselves can carry out in the shape of work?—Yes.

208. Although they may ask you for a great deal more?—They do in some cases ask for more than they can possibly spend.

209. Then you reduce the estimate before sending it to the Treasurer?—Yes.

210. You do that on revenue account?—On both revenue account and on loan.

211. Do you do that with the construction branch?—Less with regard to construction, because the amounts which may be required to deal with construction of certain new lines would be amounts really fixed by the Government itself.

212. And they would find the money for that specific item?—They find the money for those specific items.

213. But sometimes, apparently, although they promise to do it, they do not do it?—That is so in some cases.

214. Looking at the minutes of the construction department, there is reference there, time after time, I see, to the fact that the work is held up because there is not sufficient money?—That is so. That is true of nearly all the railway construction, unfortunately. The amounts that are voted from year to year to carry on the construction of certain lines are really too low to permit of thoroughly economical construction.

215. Or quick construction?—Being slow it must be uneconomical.

216. It amounts to this, does it not, that the Treasury, by reason of the condition of State finances, does cut down what your officers and you think is essential on revenue account?—It has not often been done deliberately. I can recall, I think, only one case in which a State Treasurer has altered himself the estimate of the revenue submitted by the railway administration. I do remember a case where the Treasurer increased our estimate of the revenue and reduced our expenditure so as to balance the State accounts. That is for the Treasurer's budget. That is a kind of thing, of course, that could happen but rarely. But we do get pressure from the State Treasurer, as I have already said, almost every year, if not every year, to so modify our estimates as to enable him to submit a balanced statement to Parliament. The year that we are in at the present moment—not at the beginning of the year, because our estimates are unfortunately always dealt with rather late in the financial year, but in this financial year that has just closed on the 30th June last—the Director of Finance came to see me personally, to see whether I would agree to an increase in the estimate of revenue and some decrease in our working expenditure so as to make the State accounts balance. At the moment it looked as if we might have a good wheat season, and I told him that assuming the wheat season were going to be a good one I could agree to a small increase in our estimate of revenue which he then had in his hands. I did agree in that case to increase our estimate of revenue. The wheat season did not prove to be a good one, and our estimate of total revenue will be

some two or three hundred thousand pounds less than included in the figures which are placed before Parliament.

217. Sir VINCENT RAVEN: Do I understand you to say that any modification in connection with the revenue estimates are agreed to by yourself?—They have been in most instances, not in all cases.

218. Do I also understand correctly that renewals are revenue account?—Renewals are revenue account.

219. Therefore that applies both to maintenance and renewals?—Yes. The railway administration here, of course, could seriously embarrass the Government by standing out for a very heavy expenditure on working expenses in any year.

220. Is there any difficulty in getting money that has been agreed to during the year?—Not when the amount has been agreed to, no, not in the revenue account, but in connection with the loan account difficulties may arise, even although certain estimates which have been submitted by us are approved by the Treasury and passed by Parliament. The estimates are approved, or the sums so approved, are not always available for our spending.

221. I was referring to revenue?—As to revenue, no. When the estimates have been passed the amount of money provided for under those estimates is always made available by the Treasurer.

222. In some cases the money which has been agreed to has not been always spent?—That is true. In some cases the amount provided for renewals has not always been spent. That would be affected by certain things. In certain years we might get credits owing to sales of materials and so forth greater than were anticipated, which would affect the current expenditure for the year to some extent.

223. We may assume, then, that the amount of money which was spent was sufficient to deal with all the necessary maintenance?—I do not know that that would be an absolutely correct assumption.

224. I notice, in 1922, £175,720 was agreed to be spent on renewal of engines, and only £107,461 was spent?—That is so. There was £175,720 approved in connection with renewals, and £107,461 was actually spent. What exactly was the reason for that I am not in a position to say. Mr. Lucy could possibly speak more definitely on that point than I can.

225. But the amount Mr Lucy asked for was £221,700?—He asked for £221,000, yes. He could not have spent that had it been available that year.

226. But Mr. Lucy would be the right man to ask as to why he made an estimate which he could not use if it had been granted to him?—Yes. There is a difficulty about these estimates. It may be a difficulty that you do not at present appreciate, and that is, that our estimates are very often not passed until almost half the financial year has gone. That is, estimates for the current year—for 1924-25—may not be passed until next October or November. In the meantime, of course, we have instructions from the Treasury to spend as little as possible. We cannot spend on the basis of an estimate that is particularly a liberal estimate.

227. Sir SAM FAY: Until you get assent?—Until we get assent, and that assent may not be given until next October or November, which leaves us only about seven or eight months to carry out our programme, instead of the full twelve months. We never get a full twelve months.

228. Sir VINCENT RAVEN: The estimates being sent in when?—The estimates for the current year have already been sent in.

229. You talk about October?—That is when the estimates are passed by Parliament.

230. The estimates are sent in in what month?—They are already in.

231. You mean they are already in in October?—No. They are already in the Treasury now for the current financial year.

232. You mean in June?—Yes, towards the end of June.

233. They go in in June, and they are not agreed to till November—is that it?—Our revenue estimates, as I have said, have already been submitted to the Treasury for the year 1924-25.

234. When you say already, you mean the month of June?—I mean at this moment, for the year 1924-25 the Treasurer has our estimates, but those estimates may not be passed by Parliament, as I have already said, until we do not know when. I do not remember the month last year when they were passed, but it was late.

235. Then you are already spending on the assumption that they will be passed?—We cannot spend on the assumption that they will be passed. We generally get an instruction from the Treasury to spend at the rate of so much per month, an expenditure per month analogous to the expenditure per month for the previous year, until the estimates are passed. That is our practice with regard to both revenue expenditure and loan expenditure.

236. That would be very awkward, then, if the previous year happened to be a year in which you spent very little?—Our difficulties in connection with money are considerable. They are very serious, because one cannot lay out a programme of work that one could do under a system under which it was known that expenditure would not be seriously restricted; a programme for effective operation certainly could be much more satisfactorily arranged than under existing conditions.

237. At the same time you have to maintain your line efficiently, and that has to be done with money?—That is so.

238. You cannot bunch in the last period of the year enough to make up all deficiencies in the early part?—You cannot do that, either with regard to loan or revenue expenditure. It is one of the difficulties of the present system. It is a difficulty attachable to the present system of dealing with our accounts.

239. Sir SAM FAY: You have got no renewal account at all, have you?—That is by way of reserve?

240. By way of reserve?—No. There was a small accumulation some years ago, but that accumulation was wiped out. The Government needed the money.

241. If you had a renewal account based on the life of line and rolling-stock, do you think that that would very materially add to your cost per annum? You renew now up to a point. Assuming you base the renewal account on the life, so many years, do you think that would be more than the financial situation could bear?—No, I do not. I think that if we had a renewal account the position would materially improve.

242. Assuming the money was available, it would relieve you from a good deal of this financial trouble, which must be a constant source of worry?—Undoubtedly. It would not cost Government any more, but would cost us less.

243. You could have a continuity of policy?—Exactly.

244. Which you cannot have now?—Exactly.

245. Sir VINCENT RAVEN: Do I understand from that, that if you a renewal account and renewed your rolling-stock, the amount of money spent to-day in maintenance would be very much less?—It would.

246. Because I notice that your maintenance figures are very high as compared with one's own experience in maintaining rolling-stock?—Yes. It may be that our maintenance expenditure in connection with rolling-stock is high in comparison with your own experience, because I take it our wages here and some of our operating costs would be very much greater than they are in Great Britain to-day.

247. Allowing for that, it still appears high?—That is partly due, of course, to the age of rolling-stock. We would be better off if we could have retired certain rolling-stock which is still operating, and if we had renewal accounts our retirements could have been greater than

Witnesses—J. Fraser, J. H. Cann, and H. Fox, 4 July, 1924.

they have been. With regard to waggons we are fairly right, but with regard to carriages and locomotives our position is not satisfactory.

248. I notice that your average cost per waggon is high as compared with the other States in Australia, but probably that is on account of the difference in the size and capacity of the waggon, is it?—So far as waggons are concerned, I have not made a very recent comparison with other States, but I was under the impression that our position with regard to waggons was much superior. I think that our maintenance of waggon stock is much better here than in other States in Australia. Our waggons are better maintained, and their average capacity would be certainly greater than in the majority of the other States of Australia. Per unit of capacity, I am inclined to think our maintenance would be less than in any other State in Australia.

249. But so far as the locomotives and carriages are concerned, you agree that the cost would probably have been less if you had been able to renew in accordance with the usual practice?—Yes. There are certain carriages that it would have been desirable to retire some years ago and certain locomotives that might be retired with advantage.

(At 11.30 a.m. the Commission adjourned to 2.30 p.m.)

JOHN HENRY CANN, Assistant Railway Commissioner, sworn, examined, as under:—

250. Sir SAM FAY: We have been giving some attention to the question of the absence of any reserve to meet wastage of assets or the renewal of anything in the shape of rolling-stock. You take the chair usually at the finance committee, and the construction committee?—Yes.

251. What is your view with regard to a reserve for renewal?—If there was a reserve established on a good sound basis, say, the interest on that fund would be about equal to the replacement amount per annum, it would be an ideal condition.

252. You could not hope to build up a reserve, the interest upon which would meet each renewal?—If it was found it was to be maintained by annual vote to be charged up against working expenses, I do not see a great deal in it. The other way it would maintain a fund which would be equal to the replacement, and it would make a good deal of difference.

253. It was a question entirely of renewing line and vehicles. At the present time you have nothing to rely upon except from year to year?—At present we rely on the circumstances as to whether we get a good year or a bad one.

254. That does not affect the wearing away of your assets year by year?—No, excepting, maybe, some obsolete rolling-stock which costs a good deal to repair has been left and gone on hand-to-mouth style.

255. That means instead of renewing vehicles you have repaired them?—The reserve would remedy that.

256. It would be more economical to break up the vehicle and replace it by a new one than to go on repairing it?—Frequently if you try to repair an old vehicle the cost of the repairs and the wear which you would get out of it afterwards would be the most costly way. You would get better results from the new vehicle. The same would apply to repairing obsolete machinery. It would be better and cheaper to scrap it and get new machinery.

257. If a reserve is set up on the basis of the life of anything you have got, it means adding every year to your working expenses a considerable sum?—Yes.

258. You are spending a certain sum now?—We do not allocate a certain set sum a year. We are guided by what our circumstances are. If we have a surplus, and we are able to write off, we do. If we have not a surplus, and there is a deficiency, we get through as best we can.

259. If you had had a reserve from the start of the railways here you would have been able to break up the vehicles and renew your lines with certainty year by year?—Yes.

260. With the absence of that you are guided by circumstances from day to day almost?—Yes.

261. Your opinion is a reserve is a very desirable thing to have?—I think it would be very desirable.

262. With regard to the construction department, you have a lot of plant there which you took over for construction purposes from the Public Works Department?—Yes.

263. Are you writing that off in any way?—No. We charge against the particular job that the plant is sent to, the actual depreciation of it, that is the keeping of it in repair whilst it is on the job. When it goes from one job to another, the new line is credited with the value of the plant and the next line is debited with the amount of the plant until it is shifted. It is kept in working condition all the time.

264. Are you simply providing for the maintenance and not for the renewal?—Simply for the maintenance, keeping it going. We have a considerable amount of plant. I could not say from memory what is the value of it, but I could get it for you.

265. Have you any locomotives in connection with that?—No. We borrow from the Loco. Department. We have steam shovels and mechanical plant for doing the work.

266. Sir VINCENT RAVEN: Referring to the rolling-stock, I take it you would agree to and uphold a reserve fund if such fund could be instituted?—Yes.

267. Under those circumstances you have a good deal of obsolete rolling-stock running to-day which you have not been able to renew owing to not having that fund?—Yes, we have some rolling-stock which is very old and would be better if we wiped it out altogether. We have been getting the last penny's worth out of them that we could.

268. The obsolete rolling-stock principally refers to locomotives and carriages?—Yes—and waggons.

269. You would say the same about waggons?—A lot of condemned tyres and axles and that sort of obsolete stock. When we put a new bogie underneath the carriage we take the old one out and it is left about.

270. I am referring to waggons rather?—Yes; we have a good deal of old stock about. Some have been taken out and scrapped, and some are actually running now which we could reasonably replace.

HENRY FOX, Assistant Railway Commissioner, sworn, examined, as under:—

271. Sir SAM FAY: We have been considering the absence of reserves to meet anything in the shape of wastage of assets either on the line or rolling-stock or in any other way. What is your view as to the desirability or otherwise of providing year by year a certain sum to meet absolute renewal of line and rolling-stock?—I certainly think it would be an advantage to provide a renewal fund. I do not see any difficulty in dealing with it. I take the chair at the traffic committee. I came across a good many things there which have relation to the state of the rolling-stock.

272. You would be in a position to judge as to the desirability of establishing a reserve to meet the renewal or not?—I feel it is a desirable thing.

273. Sir VINCENT RAVEN: On what basis would you start a renewal fund?—I have not given that any consideration.

274. It would have to be on the age of the stock, to keep its original capital value up?—Primarily, yes.

275. Are all the locomotives, carriages, and waggons in a thoroughly efficient condition to work the traffic?—Not all of them are thoroughly efficient.

276. Some are obsolete?—By reason of their great age. They would be better renewed with other vehicles.

277. That is due to not having sufficient funds to bear the renewal cost?—To a considerable extent.

278. If you have no shops to build them, you could buy them outside?—Yes.

(Witness retired.)

(Commission adjourned.)

## FIFTH DAY.

TUESDAY, 8 JULY, 1924.

(Held at Chief Secretary's Building, Macquarie-street, Sydney.)

## COMMISSIONERS :

Sir SAM FAY.

Sir VINCENT L. RAVEN.

THOMAS JOSEPH HARTIGAN, Chief Accountant,  
recalled:—

279. Sir SAM FAY: You gave us two statements in your original memorandum on which we did not ask you any questions when you were here before. [*Statements are printed following question 1.*] We want you now to tell us exactly what they mean. You have statements "A" and "B." You remember I said I would not ask you any questions about them when you were here before, because we wanted to clear up something else. In your "A" statement you say, "This is a statement showing the approximate interest that would have been paid on the capital invested in railways for the year ended June, 1923, if the interest had been calculated on the average rate of loans raised year by year since that date, allowing for interest on capital invested at the 30th June, 1913, being at the then average rate paid by the State loans renewed during the period." Will you explain exactly what this title means?—That is a statement showing the total capital expended at the 30th June, 1913, at the average rate that was then payable on the State debt, and taking into consideration that portion of that capital that was renewed in subsequent years.

280. At a higher rate of interest?—Yes, plus the interest that was paid on the additional capital expended year by year at the rate of interest that was paid on the loans that were raised by the State.

281. That is to say, you take the capital as it existed in 1913 at the rate of interest which was then charged?—Yes.

282. And then you add to that the capital expenditure by you since?—Yes.

283. At the rate of interest on which the State raised the loans for that particular purpose?—That is so. I divided the actual amount raised into the interest paid, taking into consideration what was provided for in the discount and floating charges.

284. Then, according to this, you have been charged £424,000 odd more in 1923 than those figures would have given?—That is so.

285. On that basis?—On that basis.

286. When you were here before you said you could not arrive at the method adopted by the Treasury for getting at this interest because you did not know what they paid to the bank for overdrafts and in other ways?—That is so.

287. It was scarcely an amount of £420,000?—I am not too sure that it would fall very far short of that on a revised method of calculating the interest, compared with the present method used by the Treasury. I believe the Auditor-General has raised the point with the Treasury in respect to the correctness of the method upon which they calculate the average rate, and that is now a subject of conference between the Director of Finance, the Auditor-General, and the Government Statistician. They have not, as far as I know, finalised a report yet for submission to the Treasurer, but it is under consideration at the present time as to whether the average rates as calculated at present are a proper method of calculating it.

288. At any rate, the way you have calculated it—that is to say, on the rate you paid in 1913, plus the rate at which the Government raised the money for additional works, and capital account since that time—you have been overcharged?—That would be so.

289. With regard to statement "B," that shows the approximate interest charges that would have been debitable by railway and tramway charges on the basis of the capital expended at the 30th June, calculated at the average rate of interest payable up to that date. Up to that point it is the same as statement "A"?—Yes.

290. "And on the capital expended each year from 1914 to 1923 at the average rate of interest paid on the net amount of the loan raised by the State"?—It is practically the same thing, excepting that no provision has been made for the higher rate payable in amounts of capital renewed of the capital from 1914.

291. So that you have not taken into account the loans that were renewed by the Government during that period at a higher rate of interest than the original loans?—That is so.

292. Sir VINCENT RAVEN: There is an increase there of £913,000.

293. Sir SAM FAY: It would be because he has not included the renewed loans during that period.

294. Sir VINCENT RAVEN: Mr. Hartigan cannot give any explanation as to what that interest really is due to.

294A. WITNESS: It is due to what Sir Sam has just said. The increase is due to the fact that I have taken the position to be that in 1914 the railways would be handed over to the Commissioners at the then rate of interest that was payable on the State debt, and no portion of that capital which would be renewed during the subsequent years at a higher rate of interest is taken into calculation in this second statement.

295. Sir VINCENT RAVEN: Does that same answer apply to the £424,000?—No, the same answer does not apply there. I have only in that first statement taken out the capital expended to the 30th June, 1913, at the average rate of interest paid in 1913. I have then taken from the public accounts as closely as I could the capital that was renewed subsequent to 1914 at the higher rate, and then each year on the amount of capital that was expended by the railways at the rate of interest that was paid for the loans raised by the Government during each of those years.

296. That is what I understood, but you cannot give any explanation as to what that excess of £424,000 is due to?—No, unless it is that the railways have been overcharged on the average rate.

297. Sir SAM FAY: There is one question here, which I should like cleared up, on the general capital account of the railways. There is a considerable amount shown for "Vote for stores and materials"?—Yes.

298. What does that mean exactly?—That means that the Government provided us with a floating advance for the purchase of stores out of capital to purchase stores for the use of the railway working and maintenance. It ought to approximate the total amount of stores on hand.

299. This was a vote of what?—It is about £1,800,000.

300. You had £1,800,000 voted out of the capital for the provision of stores. At what date would that be?—The original vote has been in existence almost since the railways' inception, I should think, increasing as the business warranted.

301. Those stores are used up?—As the stores are issued, fresh purchases are made. The purchases and issues ought to approximate one another.

Witness—T. J. Hartigan, 8 July, 1924.

302. Then, having no money of your own, you have to go to the Treasurer for additional money to make up this amount?—To make up which amount?

303. To make up your total of your vote?—The position is this. Naturally, of course, the railways require stock to carry on with. To get that stock the administration have to have money to pay for it, and that money is advanced by the Government out of loan account. It becomes part of the capital debt of the railways, and subject to interest just the same as if it had been expended on some asset. It is not in any way disturbed unless to be increased or decreased according as the traffic requirements require a larger or smaller stock of stores to be held.

304. I quite follow you. You have your stores and your £1,800,000 but those original stores, of course, have all been got rid of years ago?—Yes.

305. What I want to follow is the method of dealing with stores which you want to make up the stock that you should have on hand representing £1,800,000?—The whole of the stock is purchased out of this vote, and treated in an account known as the "purchase of stores" account. As materials are issued their value is debited to maintenance or capital, according to where used. The "purchase of stores" account is credited, so that the balance plus the stock of stores on hand makes up the total of the vote.

306. You renew it, of course, with cash which is got, I suppose, in connection with the working of the railway as such?—That is so. It is the practice for the Treasury to credit the banking account by the amount of the issues which are sent across to them in the shape of an adjusting entry. As an illustration, if there were £300,000 worth of materials drawn out of stock during the month for maintenance, or capital, or other accounts, then an entry is sent across to the Treasury debiting our revenue or capital, and a corresponding credit placed to the "purchase of stores" account by the Treasury.

307. That really is only a loan to keep your shop well supplied with material, looking upon the store as a shop?—That is so.

308. And then it is drawn out of the shop and charged off either to revenue or capital, and debited to that?—Yes.

309. Then, when you want some more stores, you get some more money, and you wait to debit either the capital or revenue till the stores are drawn out of stock?—That is so.

310. It is a cash transaction plus a book transaction. You have the money, originally the £1,800,000. You are supposed to have that stock in hand apart altogether from any increase there may be to-day?—Yes.

311. You do not check these stores at all, do you?—No, as far as taking stock is concerned.

312. The Auditor-General is responsible for looking through these accounts so far as you are concerned?—The Auditor-General, and up to within the last twelve months or so the Traffic Auditor. The Traffic Auditor would take stock every twelve months, and a balance-sheet of the transactions for the twelve months is forwarded to the Auditor-General at the close of the financial year. That officer makes test checks of the stock. In the last twelve months the stock has been taken periodically by special store inspectors who have been appointed for the purpose. The Auditor-General accepts their certificates, which are covered by a certificate from the Comptroller of Stores as to the total stock on hand at the end of the financial year. He still maintains his test checks at the end of the year. The reason of that was because of the necessity of obtaining some persons who are qualified to know the different classes of stock. It is very difficult to find sufficient qualified persons to take the whole of the stock in one month; that is the reason for the change.

313. In this particular case, when the railways were started, there was a special vote out of capital for stores?

—Yes. It was only a small vote in those days; £200,000, I think, was the first vote we got.

314. There has been a gradual increase?—It was increasing until within about twelve months ago, when, owing to the special attention given to it by the Chief Commissioner, the stock has been reduced; so much so that we were able to repay £200,000 of the loan advance back to the Treasury. In other words, we reduced the advance by that sum, and so reduced our interest charges.

315. So far as that is concerned, there is no cash in your possession with regard to stores?—No.

316. Sir VINCENT RAVEN: When stores are drawn out are they charged at the cost at which they were bought?—Yes.

317. Not the present-day cost?—No, at the book cost.

318. Sir SAM FAY: When you were here before I think you mentioned there was some difficulty occasionally in getting moneys from the Treasury to enable the work to be carried on?—That is in respect to loan, do you mean, or revenue.

319. I am not quite sure. I think you referred to loan?—Yes. In the matter of loans money, we are really in the hands of the Government as to the amount of money that they think it is either incumbent on them to raise or that they can raise. The department is, therefore, naturally curtailed, if necessary from the Government's standpoint.

320. Although these loans were included in the budget?—Yes, that is so. It may occur that way. It has occurred that way, because although certain sums might have been included in the budget the Government may not have been able to raise the money.

321. Do you deal with the construction branch at all?—Yes.

322. It would be there, I suppose, mainly that this would arise?—No. It would occur both in respect to the existing lines and railway construction.

323. You mean on capital account?—On capital account I am speaking about now.

324. Has it ever occurred in connection with the revenue account?—Not to the same extent. That is to say, when the Chief Commissioner has finally decided what amount he requires for the year, he would send a statement of his requirements to the Treasurer. Representations are perhaps made by the Treasurer for a reduction in this sum to make the budget balance, but only in one case that I know of was any alteration in the figures made without the Commissioner's concurrence. He may, of course, concur and reduce his estimates in compliance with the desires of the Treasurer.

325. You do not get the budget through till about October or November, I think. How is money obtained before the Budget is passed?—Under the Audit Act of the State, the Government are allowed to expend money out of revenue for three months without Parliamentary sanction based on the preceding year's expenditure.

326. How far do you mean, based month by month or as the total for twelve months?—Twelve months. That is to say, a quarter of the previous twelve months' expenditure could be spent in the first three months of the year.

327. You could spend in the first three months of the year a fourth of the total amount, as allocated to the three months of the previous year?—Yes, that is expended in the previous year. Your expenditure may exceed your allocation for the previous year.

328. So that although the demands of the branches and of the Commissioner may be more than the preceding year?—I do not know of any case where the Government would not give you the money if you wanted it in those three months. That is to say, if it was in excess of the previous year, you could still spend it. It may happen this way, for instance: You may get a Board of Trade's declaration raising the basic wage, say, in April, May, or June; in a case like that, naturally your expenditure in July, August, and September, bearing the increased wages, would go up

in excess of the expenditure in the previous year. In that case, of course, the Government would find the money for you. Then for the remaining months—that is to say, October and November—a special supply bill is presented to Parliament. That is a sort of a miniature estimate of the anticipated expenditure; it may be for one month or two months, and is generally passed through the House in one sitting. That provides for your expenditure for either October or November or for both months.

329. Have you had any correspondence or letters in connection with this particular matter of the difference between the amount asked for and the amount which has been advanced by the Treasurer up to October—between June and October?—No. There is never any correspondence passes in respect of it at all. We would simply go on spending unless there were some intimation from the Government. They might possibly ask for an explanation, but they do not stop us from having the money.

330. Sir VINCENT RAVEN: I think it is perfectly clear, from what you say—take, for instance, the locomotive work—that if it is necessary to spend in maintenance during those months between June and October a certain sum of money it is not objected to in any shape or form?—No.

331. If it was thought that they were spending too much, then attention will be drawn to it, and if possible it may be curtailed, the amount of money you were spending?—You mean by the Treasury?

332. Yes?—Yes, but it is very rarely done.

333. In that case it is rather difficult to understand why in a great number of years the amount which has been asked for and agreed by the Treasury has not been spent or anything like spent?—Are you speaking of any particular item?

334. I am speaking of locomotives. In 1920, £111,600 was agreed to and only £59,258 was spent. In 1921, £105,000 was agreed to and £97,818 spent. In 1922, £175,720 was agreed to and only £107,461 spent. It is rather puzzling seeing that there is no restriction put upon what they do spend that there should be actually spent so much less than they ask for?—I could not say why it is.

335. Of course it is a happy result if it does not mean any curtailment of necessary maintenance?—Yes, quite naturally it would be.

336. But they have not been restricted in any way so far as you know, in expenditure?—Not as far as I am aware.

337. I do not think that same condition of affairs is shown in any other department, except the locomotives. It is not so with carriages. It is so, slightly, with waggons. It is so with the relaying, certainly in some cases. In 1922, for instance, £600,000 was agreed to and only £392,141 used?—Yes. Of course, so far as the Treasury is concerned they do not see that relaying figure separately. It is all voted in one lump sum, and may be spent in some other direction.

338. It might be transferred from one account to another?—It may be spent perhaps under general repairs.

339. But still that particular department has asked for an expenditure of that amount?—That is so.

340. And they have not used it?—Apparently not.

341. Sir SAM FAY: This is what Mr. Fraser said with regard to this, speaking of revenue: "There is a difficulty about these estimates, it may be a difficulty that you do not appreciate, and that is that our estimates are very often not passed until almost half the financial year has gone. That is, estimates for the current year for 1924-25 may not be passed until next October or November. In the meantime, of course, we have instructions from the Treasury to spend as little as possible. We cannot spend on the basis of an estimate which is a particularly liberal one." Further on he says: "That assent will not be given until October or November, which leaves us only about seven or eight months to carry out our programme instead of the full twelve months." That is what he says with

regard to it?—Yes. Naturally, of course, the Chief Commissioner, knowing the provisions of the Audit Act, would not launch out to increase his expenditure. Supposing his estimates this year, we will say, were about a million more than they were last year he would not launch out to spend a portion of that additional million in the first few months of the year until he was sure that the Government was able to provide him with all that money and that the estimates would be passed without reduction. Otherwise, of course, if the Government desired our revenue estimate to be curtailed, he would find himself then in the position of having spent an undue proportion of the money made available in the first few months of the year. That is, assuming he would not be able to obtain this extra amount of money asked for.

342. He will be asking for what the branch asked for or something that he had reduced it by, and it looks from what he says that there is a real difficulty as between July and October?—There is only this difficulty, that as I said, the provisions of the Audit Act will only allow him to spend in the first three months of the year on the basis of the previous year, and if the Commissioner proposes to spend more next year he will naturally feel, I suppose, a bit diffident about going ahead with his programme until he was sure that the Government was going to present his estimates to Parliament in the manner in which he submitted them.

343. Apparently that is what happens, and then between October and next June there is no time for the department to spend the money they have asked for and which has been voted?—That may be so.

344. You do not audit the departmental accounts at all, do you?—No, only in relation to time-keeping. I send out an auditor to check the time-keeping work. I do not check the appropriation.

345. Sir VINCENT RAVEN: Would you know if there was a restriction so far as the money to be spent was concerned? You told me just now that there was no restriction on the amount of money that they could spend in the shops between July and October. Sir Sam Fay has rather suggested that, owing to not being able to spend more than the amount spent in the previous year, they might not be able to spend the full amount if it was left until the remaining months between October and the following June. I understood you to say that there was no restrictions?—What I intended to convey was that the Commissioner would possibly be diffident about going ahead with a programme of work in excess of the previous year, not knowing whether he may be requested by the Treasurer to curtail his estimates.

346. You mean he would give instructions to his Chief Mechanical Engineer that he had not to spend more than a certain amount?—I do not know what instructions he might give to the Chief Mechanical Engineer, further than that the work would proceed at the normal rate of the previous year, whereas the Chief Mechanical Engineer may be desirous of going ahead at a more rapid rate.

347. Of course, the Chief Mechanical Engineer is the best man to give us that evidence, is he not?—Yes, I should think so.

348. Sir SAM FAY: Do you communicate direct with the Treasury officials, or does it go through the Railway Commissioners?—All the important correspondence goes through the Railway Commissioners.

349. It does not go direct from your office to the Treasury?—No, except in minor matters, that is all.

350. But you draw all the cheques and so on?—Yes.

351. And send forward the demands to them for cash that is required?—Yes. That goes direct from me in all cases, and also all correspondence in respect to, say, opening advance accounts; anything in a matter of that kind goes direct from me to the Treasurer.

352. All other communications to the Treasury go through the Chief Commissioner's office?—Yes.

Witnesses—T. J. Hartigan, 8 July, and J. Fraser, 15 July, 1924.

353. Sir VINCENT RAVEN: Have the estimates ever been cut down by Parliament?—Which estimates are you speaking of, revenue or loan?

354. Revenue only?—Excepting in one instance I know of, not without the consent of the Chief Commissioner.

355. Sir SAM FAY: You do not deal with statistics, do you?—No.

355A. And you are not concerned with the number of passengers or the tonnage of goods?—No.

356. Do you check at all or give any instructions with regard to transfer from a revenue charge to capital, or *vice versa*, where a staff is transferred from one to the other?—No.

357. That would not come within your knowledge?—No.

358. If a department doing work on capital account and revenue account also transferred a considerable number of men from one to the other, that would not come within your knowledge?—No.

359. You have given us a statement with regard to repairs and renewals on permanent way and on rolling-stock, and I understand that, taking 1923, according to your books £400,856 was spent on absolute renewal of the permanent way?—Yes.

360. Do you get any details of that?—No, I have not the details of it.

361. Do you know where it is spent, the location of the relaying?—No. I do not get any details of the relaying.

362. What do you get from the branch accountant?—Just the total expenditure against the relaying each month.

363. But whether it is complete or partial, you do not know?—No, excepting that there is a return that is submitted to a committee, of which the Chief Commissioner

is chairman. The notes of that come to me. That shows the information. It is not recorded in my books in any way, though.

364. You have no knowledge of a relaying programme, or anything of that sort?—No, further than that the relaying programme is submitted to the Commissioners showing the proposed work to be carried out in each division; that is sent on through me back to the Engineer-in-Chief.

365. You mean that would be the programme for the year?—Yes.

366. Sir VINCENT RAVEN: It seems perfectly clear to me how you divided a partial renewal from a complete renewal, and if I understand it rightly a complete renewal means an entirely new machine—either a locomotive, carriage, or waggon. If it is a partial renewal, it means a new boiler, or new cylinder, or new crank axle, or something like that. But I would just like to be quite clear with regard to waggons. In my experience the life of a waggon is a certain number of years, but the wheels last probably twice the lifetime of the waggon itself. Now, supposing you are renewing the waggon and using the wheels over again, would that be a complete or a partial renewal?—I would not like to answer that question, because I really could not say from my own knowledge.

367. You see what I mean?—Yes, I understand. I do not differentiate in my books between partial and complete renewals. All I keep in my books are renewal costs and those figures—the separation from partial and complete renewals—I got from the Chief Mechanical Engineer.

368. And he will answer that question better?—Yes. I am not in a position to answer it.

(Witness retired.)

(At 11.35 a.m. the Commission adjourned.)

#### SIXTH DAY.

TUESDAY, 15 JULY, 1924.

(Held at Chief Secretary's Building, Macquarie-street, Sydney.)

#### COMMISSIONERS:

Sir SAM FAY.

Sir VINCENT L. RAVEN.

JAMES FRASER, Chief Railway Commissioner, recalled:—

369. Sir SAM FAY: I understand you would like to amplify the evidence you gave the other day, with reference to the question of the difficulty as between the end of one financial year and October in the next?—That is so, Sir Sam, and that would have some bearing, perhaps, on the evidence which was tendered by our chief accountant to you recently as amplification of his evidence in chief, *i.e.*, with regard to the expenditure debitable against our revenue. The point that I wanted to amplify was this, that each financial year, the State Treasurer has to make his own financial statement of the probable expenditure for the whole State for that financial year, and he, quite naturally, endeavours to balance his expenditure against receipts. In that connection, as the expenditure of the Railway Department is quite a considerable portion of the total expenditure of the State, the railway expenditure is somewhat vital in the balancing of the whole, and the Treasurer naturally asks the Railway Department to keep its expenditure within such limits as will enable him to make a balance of the whole. We get a request, almost always in association with the estimates which we submit to the Treasurer, that such estimates shall be framed on the basis of the most reasonable expenditure that can be incurred in that financial year. I dare say that since you have landed here, you may have noticed in the public press a strong demand that the State

shall reduce taxation—the people of the State are insisting upon a reduction in taxation, both direct and indirect. Well, clearly if there be any reduction of taxation, either direct or indirect, it must have an effect upon consolidated revenue—*i.e.*, consolidated revenue must be reduced if taxation is reduced; and unless expenditure can be reduced to the same extent, there will be, at the end of the financial year, a State deficit of some moment. Having that in view, if the railway estimates were based on a very liberal scale—*i.e.*, if we budgeted for a very heavy expenditure to be set against our revenue, we would either have to devise some means of very substantially reducing our working expenditure, or intimate to the Treasurer that there will be a substantial deficit in regard to our operations, and that deficit, of course, could be met only out of consolidated revenue, and might also be a direct taxation of the people of the State. When I say a deficit, I mean a deficit, not on the actual working alone, but on the working, plus the interest. As I have stated, such a deficit could only be met by the taxation of the people, and the people have repeatedly stated that they are to-day over-taxed. If, therefore, we budgeted for a very liberal expenditure, knowing that that expenditure must be met by direct taxation, the Treasurer could say to us, "We, the Government, do not propose to increase taxation in order to meet any additional burden that may be imposed upon us through any deficit in regard to the operations of the railways, and you must therefore endeavour to keep your

working expenditure within such limits as will permit the revenue to cover the whole of your working expenditure, plus your interest." That is the attitude which a Government could quite properly take in view of the attitude of the people of the State to taxation. Bearing upon that, I should like to read a letter which I received at the beginning of last financial year, when our estimates had been submitted—and it is a letter similar to those that I have intimated we constantly receive from the Government at the beginning of each financial year. It is headed, "Estimates of expenditure, Consolidated Revenue Fund," and states:

The following copy of a communication, dated 23rd August, received from the Director of Finance, is forwarded for favour of attention by your Commissioners. Your draft estimates for 1923-1924 are returned herewith for favour of revision. The total estimates received from all departments exceeds the estimated revenue for the current financial year by fully £1,500,000, and it therefore becomes necessary to reduce them by that amount. The Colonial Treasurer desires that you will be so good as to give this your urgent and personal attention, and let him have your revised estimate at the earliest possible moment. It is imperative that all departmental estimates be reduced very considerably, and only essential items included.

N.B.—Your estimate of expenditure exceeds your last year's expenditure by £146,578. Owing to the increase in salaries, payment for interest, and other statutory payments, contingencies expenditure must be brought very considerably below that of last year. It will be observed that the 1922-1923 expenditure column is incomplete. Will you please have the remainder of the figures filled in against the respective items.

My point in reading this is to indicate that the State Treasurer in that year—as, indeed, in most years—finds it imperative that all departmental estimates be reduced very considerably, so that he will be able to balance his expenditure against receipts on consolidated revenue. That does not refer to loan expenditure, but to consolidated revenue. It relates purely to cost of working.

370. Sir VINCENT RAVEN: Does not he cover himself there by asking you only to reduce in non-essential?—He says, "It is imperative that all departmental estimates be reduced very considerably, and only essential items included."

371. He therefore allows you to put in everything that is essential, but asks you only to knock out non-essentials?—Quite so, but then there is the point as to what he would regard as non-essential.

372. Or, as to what you would regard as essential?—Yes, quite so. "The total estimates received from all departments exceed the estimated revenue for the current financial year by fully £1,500,000, and it therefore becomes necessary to reduce them by that amount." That is to say, that on the Governmental side a very heavy expenditure was to be incurred, and that he would take up a similar attitude to other Government departments to that which he had taken up towards our department.

373. Sir SAM FAY: The estimates of revenue would include your estimate of revenue from the railways, from two sources?—Yes.

373A. In making that estimate twelve months ahead, you are gambling on what Providence will do for you, are you not?—We are gambling on the seasons, of course. We have to do that, more or less. We may estimate at the beginning of the year that we are going to have a good wheat season, and in June or July the prospects may be quite bright, but in August or September they may become distinctly otherwise—and that was the chief point which I wanted to make; that is that if we framed out estimate of expenditure on a high scale, the expenditure and interest taken together would probably be considerably in excess of the total revenue which we would be expected to receive and would leave what we call a deficit, and that deficit would have to be made good out of consolidated revenue. The framing of estimates on a liberal basis would undoubtedly in some cases, seriously embarrass the Government, and the Government could say to us—

and quite properly from their point of view—that they do not propose to increase the burden of taxation on the people as a whole to meet any deficit arising through railway administration.

374. I believe you have an Act of Parliament under which you cannot spend beyond what you spent the previous year until after Parliament has passed the budget?—That is the Act, and that is the understanding.

375. Does that have an effect on you?—It has had a deterrent effect, obviously taken in conjunction with communications of the kind I have just read—it has a deterrent effect in connection with the mapping out of a programme of expenditure during a given year. No one in an administrative position can lay out a programme of expenditure for a whole year unless he knows that the money will be made available to spend, because if you are mapping out a programme for twelve months, you really want to begin to spend on the first day of that twelve months and continue your expenditure fairly consistently throughout that whole period. That is a thing which the Railway Department has never been able to do, either from loan, or on the working expenditure side.

376. One cannot help noticing the moneys that have not been spent, even after they have been voted. Has that been brought about by "going slow" at the commencement of the year?—To some extent it has been so, because, as indicated here, the Government asks us to make our expenditure during each month—until the estimates have been actually passed—approximate as nearly as possible to the expenditure per month in the previous year. They ask us to do that.

377. So far as they are concerned, they pass it *en bloc*—they do not deal with it departmentally like you do?—No.

378. It is a certain sum which you allocate yourself in accordance with these figures?—Yes. They sometimes, when our estimates are under review, may discuss an item of £1,000. They may spend a lot of time discussing one or two such small items, and then, after a long discussion, pass the whole of the estimates. That would be some months after they had been submitted by us to the Treasurer.

379. I do not know if you have seen those statements which Mr. Hartigan put in, with regard to the interest charged against you?—Yes, I saw those.

380. He put in two, and he is evidently of the opinion that the railways are considerably overcharged in the shape of interest. Statement "A" shows that excess interest has been paid to the amount of £424,000. That is a great deal of money. I do not think that statement "B" would be a correct view of the situation?—Probably not.

381. But, statement "A" would appear to be somewhere near the mark. I think he said that the Auditor-General, the Treasurer, and the State Statistician were, I assume, a sort of committee looking into this question. Have you any idea when they are likely to come to a conclusion?—I cannot say, definitely, though I hope it will be soon. I may say there is a good deal of foundation, in my opinion, for Mr. Hartigan's belief that we have been charged too much interest for some years past. I may point out that the Government Statistician, on page 72 of the Statesmen's Year Book, states that the public debt (proper) on the 30th June, 1923, was £183,571,556, which includes the Railways and Tramways, and everything else debitable against the public debt proper. A note on the same page gives the total amount of interest due on the above debt as £8,535,650. That £8,535,650 is obviously considerably less than 5 per cent., because 5 per cent. on £183,571,556 would be somewhat over £9,000,000 per annum; and this £8,535,650 comes very near to the 4·8 which I mentioned just now in conversation (a conversation which, by direction, was not included in this report). That would seem to support our contention, and Mr. Hartigan's calculation here, that the interest rate has been somewhat higher than might properly have been imposed upon us.

Witnesses—J. Fraser and W. H. Denneen, 15 July, 1924.

382. There was one question which I put to Mr. Hartigan when he was here, with regard to an advance for stores of something like £1,800,000. That really means, does it not, that your stores are costing you, on a 5 per cent. basis, something like £90,000 a year, and more than the figures you show, if you add interest?—Yes, but those charges have to be distributed.

383. I know that, but I mean to say, that as part of your loan you have stores amounting to £1,800,000?—It is considerably less than that now. That is about the maximum that we reached. No, I think we went a shade higher than that, but at any rate we are down now to about £1,500,000.

384. But whatever it may be, if I understand it rightly, that is an amount upon which you have to pay interest?—That is so.

385. Would not it be better to have wiped that out gradually by departmental charges?—You could never wholly wipe it out, because we have always to carry stock. I do not see how it is to be escaped. Of course it is debatable as to the amount of stock that should be carried. Stock must be carried to enable us to provide the material required from day to day and from week to week for the various departments to enable them to carry on their operations. The position is that we convert money into stock, and that stock is left lying in our stores for use from day to day. That means money.

386. If you had your own banking account, you would be in a different position—unless, of course, you had an overdraft at your bank?—Quite so—although we would still have to buy the stores and pay for them. What I have been endeavouring to do for a number of years—and with some success—is to substantially reduce the stores stock and automatically reduce the value debitable against the stores advance account, and we did on one occasion pay back £200,000 odd in reduction of that amount, and our stock to-day is relatively lower than ever before, I think. We are always trying to get our stock down to the minimum.

387. Sir VINCENT RAVEN: That means that you have got that certain amount of economy, but the economy is only shown in the interest on the money that you have got invested in stores?—Yes.

388. Sir SAM FAY: It would be an advantage if you, could ease yourself of that situation, would it not, and if you could knock out the £200,000 you could practically wipe your stores account out?—Yes.

389. You had that charge against you all the time, which you have to earn?—Yes. At this stage I should like to mention that in giving evidence here the other day my evidence clashes somewhat with the evidence given by Mr. Hartigan as to the method of check on the stores. I stated that it had been our practice—and was—to have the stores checked to some extent, though not completely, by the Traffic Auditor. Well, that was our practice until comparatively recently. I did not qualify it by saying that there had been any variation. As a matter of fact, there has been a variation recently, as indicated by Mr. Hartigan in his evidence. When the Traffic Auditor's check was unconvincing—really because it only covered a limited area—we arranged for a constant check to be made by inspectors specially appointed for that purpose, and these inspectors are checking from year's end to year's end and doing nothing else; and the check is to-day so much more thorough and so much more effective in respect of stocks carried and so forth, than formerly, that we have been able to reduce our stores advance account very substantially, as I have already indicated.

390. Who are they under?—They are under the control of the stores. The controller, when giving evidence, will be able to elaborate that point, and I think he would say that he would welcome the closest scrutiny of his work. The work in the stores is better done now than at any former period.

391. There is a great deal of stock held in the shops and various parts of the line which has not been charged out to the particular work, is not there?—Not yet.

392. They are not under his direct control, are they?—Not in all cases.

393. But they do take a periodical check of those, do they?—Yes, those are stocks that are checked constantly. We have stocks in the permanent-way branches—each division—the permanent-way stores at Goulburn, the permanent-way stores, Bathurst, and the one at Newcastle, but the one at Newcastle is directly under the control of the Comptroller himself, and that particular store at Newcastle holds the stock for all branches—that is the only one that we have so far amalgamated in that way. That is an experiment to see whether it would be successful or otherwise, and it has been so successful at Newcastle that we will probably introduce the same system at other large depots, with the object, of course, of reducing the total stocks.

WILLIAM HENRY DENNEEN, Traffic Auditor, New South Wales Government Railways and Tramways, sworn, examined:—

39. Sir SAM FAY: Your business as Traffic Auditor, so far as I am able to ascertain from your statement, is confined entirely to receipts?—Yes, I do not deal with expenditure.

395. You have to audit 572 stations, and there are 738 unattended sidings and so on attached to the stations, the accounts of which I suppose are kept at the adjoining stations?—Yes.

396. You have fifty-three refreshment-rooms to do?—Yes.

397. And all the tramway depots?—Fifteen of those, seventy-five railway institutes, and thirty horse fodder depots. I have ten inspectors to audit all these stations; they get round once a year, and oftener when it is found to be necessary.

398. How long does it take them to do a station?—It depends whether they strike any trouble at the station; two days as a rule for a big station, and smaller stations, of course, less. They are not always at work, weekdays and Sundays; they all work weekdays. They work to a roster. We have no trouble in effectively covering all these stations, refreshment-rooms, and tramway depots. I could let you have a copy of our audit inspectors' travelling roster.

399. If they do all that you say they do in your memorandum, it must take them some considerable time?—Yes. They have to travel from one station to another. Of course, you know there are 1,310 railway stations, sidings, and platforms altogether, but of course the sidings and platforms are controlled by the station. We have 572 stations. We take stock of the refreshment-rooms, whatever is in them, and the tramway depots too. There are only 300 working days a year approximately, but some of the stations are very small, and it does not take them long. We do not check the Comptroller of Stores' stock now; we only took stock and compared same with the Comptroller's ledger balances. We are checking horse fodder depots, amongst other things—contractors' accounts and the number of horses employed at certain depots, and the average price per week per horse—what it costs; that is checked on the spot. These horses are under the Existing Lines and the Construction Branches of the Railway Commissioners. The Engineer-in-Chief of each branch is responsible for the horses and the horse fodder; the staff under them purchase the horses and fodder subject to Commissioners' approval. I believe a great many of these fodder accounts are contracts; that does not come under me; the Comptroller of Stores deals with contracts. Of course, he buys in the cheapest market.

400. I see somebody gives a certificate here as storeman. Whose certificate would that be—would that be your officer?—(Looks at document.) That would be signed by the officer in charge of the depot.

401. You have a considerable number of errors at your stations, I notice?—Yes, I think they are decreasing. A good many of them are in classification, goods and live stock too—the usual errors inseparable from accounting between one station and another. Very little indeed of that represents cash as between the Commissioners and the public; it is more of adjustment between stations. That large amount of £112,000 is something we do not allow the stations to deal with; it is personally certified by the Traffic Auditor. That is not a discrepancy; those are actual payments for rebates.

402. Looking at the headings, it would rather look as if it was some error on the part of somebody?—No. Those are rebates paid to the public, £112,000. There has been no mistake made by anybody there. It is on goods, flour, fodder, seed wheat, and so on.

403. Take the amount of £37,000 shown on your abstract; is that an actual discrepancy?—Oh, no, that would be an adjustment between two stations, not an actual discrepancy at all.

404. The heading says, "Discrepancies discovered"?—They are mere adjustments. Those are the result of our examination in the office, between the two station accounts. I mean that one station took a debit that the other should have had, and sometimes a station might get a consignment of goods uninvoiced, and of course, the public wanting them, they would have to deliver, and the sending station might invoice later on.

405. There is a discrepancy if there was a failure to invoice?—Yes, but the invoice is delayed in transit very often.

406. At any rate, those are simply adjustments; they do not mean cash?—They do not mean cash.

407. Will you let us have the roster of the travelling auditors or inspectors, because I really do not see how ten men could adequately cover all these stations?—Some of our stations are very small, it does not take very long. With regard to the refreshment-room accounts, we actually take stock there of what they have in hand. I have nothing whatever to do with the purchase price, nothing concerning expenditure—that is altogether outside my purview, it would come under the refreshment-room manager.

(Witness retired.)

PERCIVAL SYDNEY HUNT, Estate Agent and Refreshment-room Manager, New South Wales Government Railways, sworn, examined, as under:—

408. Sir SAM FAY: I see you estimate the value of the real estate of the Commissioners at £5,433,563?—Yes. That refers practically to the unimproved value of the land, plus the value of our letting properties. It would include the running line. It does not represent what the land actually cost, but what is considered the present market value, unimproved. You can give a market value to a line of railway if the line was removed. The figure has been closely scrutinised, inasmuch as it is made up of all the assessments of all the shires and municipalities throughout the State; that is the figure on which we are assessed. They assess us on the value of the land, not on the value of the traffic; we are charged on the unimproved capital value. That is the general rating principle in New South Wales, the unimproved capital value. That is assuming the land is cleared of everything. That is represented by that figure, £4,125,000, the £5,000,000 is an addition on account of the improvements on letting properties. The rents received represent improved properties or grazing areas or cultivation areas, outside the specific railway occupation.

409. I see that according to this, that gives you 2½ per cent. on your estimated value?—Yes, about that. Of course, I would like to point out that a large amount of that £5,000,000 represents city property, property in Sydney, houses, and so on. We have some pretty valuable property in Sydney in the shape of houses and so on. The bookstall rents are rents assessed; we invite tenders every two or three years, as the case may be, and the highest tender is generally accepted. It is a dead rent, absolutely net. There has not been very much competition for previous years, but there was last time, for the first time for several years. Previous to the war there was competition, but during the whole term of the war there was no competition at all. Last time we had another big firm, Dymock's, which came very close; we are calling tenders at the end of this year, and I believe there will be half a dozen at least in for it. The last tender was for three years.

410. You refer here to surplus lands available after construction is completed, and you say the Estate Agent is responsible for intelligently dealing therewith. Do you mean by re-sale?—Yes. The figure of £63,000 for 1923 would not actually represent cash received; most of our land is sold on time-payment. But it would represent the capital obtained, allowing for time-payment sales; that is the amount we would receive on time-payment. That is actual surplus land sold. When a new railway is made I buy the land—we first resume, in nine cases out of ten, but if there is any possible opportunity of private purchase prior to resumption we effect it. I control the whole of the acquisition, either by resumption or private purchase. By resumption I simply mean that a railway is proposed to be constructed, which covers so many miles of country, so many acres of land, and we simply make a general notification, covering the whole acquisition by the Crown. In a great many cases it would cost nothing so far as country lands are concerned, because betterment applies; such betterment does not apply in Sydney. We do resume in Sydney, but it may be accepted that in every instance payment has to be made. Such liability always applies except where betterment from construction work can be established. There is no fixed rate. Ninety-nine times out of one hundred it is amicably settled, or it goes to arbitration before the Court; I do not think I have had a case for the last three years.

411. You are responsible for the refreshment-rooms as well, are you not?—Yes.

412. You buy all the various stores required—by contract?—I endeavour to buy by contract as far as I possibly can, but there are certain proprietary lines in regard to which there is no advantage in entering into a contract—you have to deal direct with particular firms. The contracts are by tender, advertised, and there is very strong competition. The tenders are sent to the secretary to the Commissioners.

413. You are returning on the estimated or actual amount of money invested in your refreshment-rooms, 5 per cent.?—I cover myself in the first instance with the recognised interest on capital, which is a little over 5 per cent.; that is to say, I am returning very nearly 10 per cent. on my working, exclusive of interest on capital. I allow depreciation on buildings, 2 per cent. on brick and 5 per cent. on weatherboard, and 7 per cent. on stock. Last year the depreciation I allowed on buildings was just on £4,000 and on equipment nearly £7,000. On top of that, of course, I also pay all maintenance charges and everything else. On equipment, furniture, &c., I allow 7 per cent. depreciation.

414. After doing that, you return on the actual working about 14 per cent., and after you have paid 5 per cent. interest you have got a clear 9 per cent.?—Yes. Of course, my balance-sheet is not altogether on the same basis as an ordinary company balance-sheet; an ordinary company would have a certain capital, say, £200,000, and if it had a profit of £20,000, they would call that 10 per cent.; but

Witnesses—P. S. Hunt and C. B. Byles, 15 July, 1924.

before I declare a profit I cover the department for the interest on the capital involved, and then declare a net profit on top of that.

415. Sir VINCENT RAVEN: Have you anything to do with advertisements?—No. They are run by a separate branch, the advertising branch.

416. Sir SAM FAY: He puts up advertisements in your refreshment-rooms, I suppose?—No, he does not; I have no advertisements in my refreshment-rooms at all, none whatever—except perhaps a minor line, such as advertising Capstan cigarettes or some popular thing of that kind, and that is all under my own personal control. I do not have any advertising either inside or outside the refreshment-rooms.

417. Sir VINCENT RAVEN: You charge interest on all the equipment you have, I suppose?—Yes. As a matter of fact, the stock goes into my capital account, which totals about £275,000.

(Witness retired.)

(At this stage the Commission adjourned until 2.30 p.m.)

2.30 p.m.

CYRIL BEUZEVILLE BYLES, Signal Engineer, New South Wales Government Railways, declared:—

418. Sir SAM FAY: I understand that you have a mechanical assistant attached to your department as well as an electrical assistant?—Yes, for the outdoor work.

419. Do you consider it necessary to have two men for signalling?—I think so, because their sphere of work is entirely separate. One looks after the installation and maintenance of the mechanical signalling and interlocking work, and the other deals entirely with electrical matters which, of course, include block-working and staff and tablet-working, and so on, in connection with which there is an enormous quantity of detail. Quite apart from that, up to the present I have not been able to come across a man who can perform the dual functions, even if the extent of the work permitted him to do so.

420. But it is all signalling?—Yes, in the broad sense, but not in the narrower sense, because until quite recently block-working and telephones and work of that description was not regarded as signalling.

421. But you combine both?—Yes.

422. And your district inspectors combine both?—Yes, but it is only after a considerable evolutionary process that I have been able to get the men to do both. It was only after a considerable amount of training, and only quite recently that I have been successful in obtaining men to combine them.

423. But if you have an assistant, be he a mechanical engineer or be he an electrical man, would not he be able to acquire the same knowledge as you have?—Probably.

424. I am only looking at it from the point of view of expense. You cannot get two men at the same price as one, and I suppose each of them has assistants or clerks?—No, the mechanical man has nobody, being entirely by himself. The electrical man has two technical assistants and a clerk. The detail that has to be dealt with in his office is very much greater than in the other case.

425. But when you come back to it, it is all a question of the theory of signalling and the appliances necessary to operate your signals, whether mechanical or electrical?—Yes. I think ultimately the thing might be combined, but from the point of view of expense it would make very little difference, because a joint man would need to have at least two similar men under him.

426. Apparently there is a certain amount of division of the same class of work between yourself and the Chief Electrical Engineer?—Only to a very very limited extent.

427. The Chief Electrical Engineer maintains certain telephone circuits, and so on, and he maintains throughout the line certain instruments?—In the country he maintains telegraph instruments. He maintains the telephones from Sydney to Newcastle, and on the South Coast line, and in the suburban area.

428. Is there any particular reason for that?—No, it has simply arisen by the process of evolution. He used to maintain the whole lot, but I have gradually taken over first one thing and then another.

429. Is there any reason why you could not take the lot?—Not from my point of view.

430. He maintains the Morse instruments throughout the whole system?—Yes. From his point of view, he considered it better to retain the control of those.

431. Does it not mean that he must have a certain number of men travelling about the whole system to look after those instruments?—Yes.

432. And you have a certain number of men travelling about looking after other instruments side by side with the Morse?—Yes, but the Morse is relatively a very small matter.

433. And he maintains the batteries?—Yes, the Morse batteries.

434. Side by side with your batteries?—That is so.

435. When you come to your power supply, is the Chief Electrical Engineer responsible for that?—He generates the power and transmits it.

436. And you take on from the transformer?—That is so.

437. He does not go beyond that?—Not on the signalling mains.

438. You state at page 6 of your memorandum—"In the country districts it is not practicable to make the maintenance districts for mechanical and electrical work co-terminal, as the latter usually embraces a much larger area than the former, hence the maintenance of the mechanical and electrical work is placed under two separate men, known as signal sectionman and railway electrician respectively." What do you mean exactly by that; do you mean that there is too little work on the electrical side to justify the making of the areas exactly the same?—Yes, that is what it amounts to in the country. The railway electrician can cover a very much larger geographical area than the signal section man, but there are exceptions. With a great number of automatic signals he may maintain about the same area, or even less, but for various reasons it has been found impracticable to make them the same.

439. Still you have your electrical inspector?—No, this refers entirely to the maintainers. They are under one inspector.

440. Assuming that you took over the maintenance of the Morse instruments, would not that come under the electrical staff?—It would come under the electrical maintainer, whom we call the railway electrician.

441. If you had it instead of the Chief Electrical Engineer, would you put that under him?—Yes, it would be added to the rest of his work.

442. I see that in some cases of automatic signalling you take over the responsibility for signal lighting, and in other cases you do not. Who looks after the signal lighting where you do not do it?—The traffic do it themselves. At a country station where they have a staff it obviously pays to use their staff, because they probably have a fair amount of spare time.

443. What sort of lighting have you?—There is a considerable area lighted electrically in Sydney and one or two country centres. Wherever we can get power we are considering electrical lighting, but for the rest it is kerosene oil, long-burning lamps—seven days.

444. Do you get longer than seven days out of them?—I have never attempted to, but I do not think we could satisfactorily.

445. On page 8 of your memorandum you refer to new works. Are you doing that on behalf of the Engineer for New Works under the Construction Department?—Upon existing lines, new works are carried out by the Engineer-in-Chief for Existing Lines. Upon new railways they are carried out by the Chief Engineer for Railway Construction. In both cases the signalling work is carried out by me. There is a separate estimate for

the signalling work, and this, in either case, is included in the amount authorised for the work as a whole.

446. And that is charged to the cost of construction?—Yes, as part of the cost of construction on loan account.

447. Have you an accountant?—Yes.

448. Does he allocate to construction work the necessary proportion cost of your department?—Yes, the actual cost of the signalling done for that particular work.

449. Take the line from Molong to Dubbo, would he charge on construction account simply the cost of the work on the ground?—That is practically what it amounts to, and the cost of supervision of the men actually engaged in constructing the work.

450. He would not charge to that account anything in the shape of office expenses or headquarters expenses?—No, only the cost of the supervision on the ground.

451. I suppose you are doing a very great deal of work in connection with the new City railway?—We are contemplating a good deal, but there is no actual work done in connection with it at present.

452. What sort of signalling do you contemplate putting in on that underground line?—Of course, it would be automatic signalling, and with colour light signals.

453. What type of automatic?—Electrical automatic, except that I propose to work the train stops, and possibly the interlockings, with electro-pneumatic. Experience has shown that the electro-pneumatic is less costly to maintain, but the chief reason is that we have plenty of air pressure available, and that being so, it is more economical to use it.

454. From where do you get your air pressure?—I have a large compressor plant just outside the station at Redfern. That handles the whole of the Sydney yard installation, and the suburban automatic signals out as far as Sydenham in one direction and Ashfield in another. It would be quite a simple matter to make use of that air supply for the City railway.

455. Do you think you have sufficient power there to deal with the City railway with comfort?—I think ample, but the air requirements on the City railway would be relatively small. The signals would necessarily be entirely electrical; there would be no moving parts at all. Practically the only air supply necessary would be for the train-stops and the small interlocking.

456. You think that the electro-pneumatic signalling taken over a number of yards is less costly to maintain than wholly electrical?—Everything depends on the air supply, and in this case we have the air supply. If I were starting *de novo* I would hardly contemplate putting down an air supply, but having got it, I think the electro-pneumatic is certainly more easily maintained, and gives rise to fewer failures.

457. Is it not really a question of the depreciation of the pipes where you have the pneumatic installation?—It was installed in the Sydney yard about 1910, and we have never had any case of air-pipes having to be renewed. The only thing that has to be renewed is the indiarubber connection, but the pipes themselves have never been renewed. We have never had any failures with them.

458. How long do you reckon they will last?—I should not like to say, but I think a great many years. A great proportion of them are run overground, where they can have attention if necessary, although we do very little to them, except a coating of tar. They are steam pipes, mains 2 inches and sub-mains about  $\frac{1}{2}$  inch. This is the result of a conversion which has been going on for years. Had I been asked my opinion ten or twelve years ago I should have said that I would not put down any more electro-pneumatic, but the experience of those years has shown that it gives less trouble.

459. Is it as easy to get at as an electrical installation?—The mechanisms are so simple, there being nothing but a cylinder in the piston. The only feature of the electro-pneumatic which is at all liable to cause trouble

is the leather in the pistons. If we do not watch them carefully they will perish and blow out occasionally.

460. You have electrical power and you have pneumatic power to keep going all the time?—Yes.

461. If you were starting *de novo*, you would put in electro-pneumatic in the City yards?—I think I should hesitate before putting in work like that if I had to build up the whole thing from the beginning.

462. You are going in for a city railway with very heavy traffic on it, and you are proposing to continue a system which must mean the production of two powers, and I assume that having done that, you would continue it under the electrified suburban lines?—Not beyond the limits to which it goes now.

463. Are not the electrified lines going out about 30 miles?—Yes, ultimately, I suppose, but I would not think of extending the electro-pneumatic to that distance from Sydney. I went into this matter some years ago, and I found that the cost for electro-pneumatic was practically prohibitive in comparison with all-electric, but that does not apply in a restricted area, and particularly where we are already committed to keeping it going for a number of years, as in Sydney yard. Making a complete upheaval in Sydney yard could not be thought of. Having got it, and having to maintain it, my idea is to make the best possible use of it.

464. You have electro-pneumatic signalling for the whole of your Sydney yard?—It is now, and has been since 1910. The recent change consisted of installing an entirely new locking-frame, fitted up to receive the functions of track locking. The old system made no provision for track locking. We had to go in for track circuit, which we had not before the recent change, except to a very limited extent.

465. Having got it, you think you should continue it—this is a costly thing, and I want to know whether you are right?—The whole cost resolves itself into one of mains, but we have the air practically as a free gift.

466. Oh, no, you have not?—It can really be calculated in units of current. Then there is another point that I should like to mention. In my present shops I also take advantage of the air pressure to work what were steam-hammers. When the shops go away the steam-hammers will go too, and I shall have that reserve of air, which can be usefully employed. It has to be produced, but the plant is there and its maintenance has to be paid for.

467. Sir VINCENT RAVEN: I gather that you have more chance of failure with the electric than with the electro-pneumatic. Is that on account of the dampness getting into the electric, getting shorts or something of that kind?—I should like to make that statement quite broadly. Generally speaking, I feel more comfortable in the maintenance of the electro-pneumatic than the electric, and I think the answer is that the electrical apparatus required in connection with the working of points and signals is necessarily of a complicated character, because you have to convert a rotary movement into the thrust, but in the electro-pneumatic you have the thrust all ready. In other words, the electro-pneumatic is so much more simple, and there is less complication to get out of order.

468. I have never discovered any particular reason for the electric apparatus getting out of order?—I know the modern apparatus is very high-class and gives comparatively little trouble, but obviously there are more points at which failure can occur than is the case with the electro-pneumatic.

469. Of course with the pneumatic you have to be very careful, in regard to keeping everything tight, and if it is not tight your power has gone?—Since I came here I have only known one serious breakdown due to failure of air, and that is when a 2-inch main blew out at the coupling.

470. That may be so, but I fail to see why there should be more liability to failure with the electric system if it is looked after in the same way?—I make the statement quite broadly. That seems to be our experience.

Witness—C. B. Byles, 15 July, 1924.

471. Apparently you have had a fairly long experience with the electro-pneumatic, but what experience have you had with the electric?—The first electric installation was put in here a little over ten years ago, but not at Sydney. The plant was comparatively large; there were about sixty levers and seven junctions. It is at Flemington, which is the nest of junctions off the main line about 8 miles out of Sydney.

472. And you have had a good deal of trouble with them?—No, I do not wish to convey that impression at all. I am merely saying that, all things being considered, and taking into consideration particularly the conditions which will apply on the city railway, I should feel happier with an electro-pneumatic installation than I should with an electric.

473. Have you gone into the cost of one as compared with the other?—Not so far as the city railway is concerned, though I have on the main suburban line.

474. Who decides upon the position of signals?—The signals are shown on a plan which is signed by the officers and submitted to the Commissioners. This plan is prepared by me, of course, and having been prepared is sent round for signature by all the officers concerned, and is finally approved by the Commissioners.

475. It is a joint agreement?—Yes, to that extent, but of course it emanates from me.

476. What I am really desirous of knowing is whether the people who use these—after all you do not use them because they are for the purpose of the safety of the people who are using the railway—have the right of approval or disapproval of the positions which you apparently fix on your plan, and to what extent?—It rests with the Chief Traffic Manager, of course, if he does not approve of the arrangements shown on the plan, to say so.

477. What part does the Chief Mechanical Engineer take in it?—In connection with the plan.

478. It is an agreed plan?—Certainly.

479. It is agreed between the traffic and the locomotive and yourself, that is the position of the signals?—Yes.

480. Sir SAM FAY: Your accountant apparently is responsible for the stores?—The stores under my control.

481. He has a storekeeper under him?—Yes.

482. The accountant has?—Yes.

483. Have you very much really in the shape of stores that are not actually charged out to your branch?—I am afraid I do not quite follow you.

484. You have a certain number of stores under your control; have they all been charged out to work which you do?—Oh, no! All the stock in my stores is in the trust stock account, and I can only touch that material by ultimately giving a requisition to the Comptroller of Stores.

485. But still it is all under your control?—It is under my control, but it is not charged to any particular job; it is actually in trust stock.

486. So that until you give in some shape or another a form stating that you have taken so much stuff it is assumed that that stuff is in the possession of the Commissioners?—That is so. It is not only assumed, but it is checked at intervals.

487. Who checks it?—There is a yearly stocktaking under the Comptroller of Stores; his men come round and take stock.

488. Of all the stores which have not been actually charged out to work which you do?—That is so. If it is once charged out to work he has no further connection with it. We aim at never charging material out until it is actually required.

489. What is the system of your automatic signalling;—is it normally clear or danger?—On straight-out automatic sections it is normally clear, in the interlocking areas it is danger.

490. You work automatically clear for signals which are not adjacent to stations?—That is the case, with one or two exceptions, for other reasons altogether. For instance, on a single line, on the Molong-Dubbo, we found

it simplified the circuits to make the signals all at normally danger.

491. I notice some of your single-line stations have two outer distics; was there any particular reason for that?—We call them an outer and an inner distant. Do you refer to one following the other?

492. I refer to two distant signals on the same post?—There are very few cases of that kind.

493. What is the idea?—That came about in this way. We declined to give a distant signal for a turnout unless it shows by its form that it is a turnout. In that particular case, I think, probably you are thinking of a place called Duri, on the northern line. The platform is on the turnout, and we give the splitting distics, in order that the driver, in coming to the turnout, may not be unduly checked, but we have done it only in exceptional cases.

494. Is that because the leads are too short to run through at speed?—Yes, that is so.

495. You are a little bit afraid of it?—Yes. I would not say we are afraid of it, but it is a place where speed should be restricted.

496. I did not quite follow why you had the two?—It is a very, very rare thing. I do not think we shall do many more like that.

497. The Molong-Dubbo single line is about 80 miles?—About 80.

498. How many stations on it?—There are four passenger stations.

499. Are they spaced with a view to through running without delay?—The way we have dealt with that is that there are the four stations which are used for traffic purposes, and intermediate between each of the stations is a crossing loop which will be unattended, the object being to space the whole line about equal.

500. What do you mean, in distance?—In time, in running time.

501. They are spaced with regard to time and not distance?—Yes, we have endeavoured to give a headway of about 20 minutes for goods trains.

502. That is to say where you get a rising gradient in the one direction and a falling gradient in the other, the spacing is on time and not on distance?—Yes, that is what we have endeavoured to do. That is subject to the question of the best place to put the crossing loops.

503. What was your estimate of the automatic signalling of that railway?—I have not it in mind, but I could give you the figures.

504. What would have been the ordinary cost of working?—An estimate of manual signalling was prepared, and an estimate of the automatic signalling, and we then calculated the saving in traffic staff that there would be if the automatic signalling was put in, and we set off one against the other, and the net result showed a very considerable saving in favour of automatic signalling.

505. What staff do you get rid of at a station?—At all these unattended loops there would be no staff at all, whereas, of course, if it had been manual signalling there would have to be a staff, and at the stations they will only require to be on duty when it is actually necessary for traffic purposes or for crossings.

506. How many crossing loops have you got?—Five crossing loops.

507. In the 80 miles?—Yes, apart from the four stations, that is nine places where crossings can be effected.

508. Is there any control of the running of those trains?—Yes, at the middle station, which is known as Yeoval, we are going to station a traffic controller, who will have at his disposal a selective telephone system throughout the whole of the line, and he will control the whole of the running. We propose to give the drivers of all trains entering on the section a crossing order card, giving them where they may expect to have to cross, and the controller may change the places of crossing if he wishes by communicating with the drivers afterwards.

509. What is the real object of automatically signalling that length of line. According to your time-table there are only ten ordinary trains in one direction and seven in the other. It is a costly process signalling automatically?

It was all worked out on the basis of what would be required to handle the traffic if it had been done manually.

510. You have not finished the work, I suppose, have you?—No.

511. Could you give us your estimate for automatic signalling as against the manual?—Yes, I could give you a statement I prepared for the Commissioners, showing how the saving would be effected.

512. Is it anticipated that there would be many more trains than the ordinary trains shown on the time-table?—That is a question which I should perhaps leave to Mr. Hodgson to answer, but no doubt that was taken into consideration. He told me what headway he wanted, and I laid out the signalling accordingly.

513. I am assuming that the object of the line is to take the traffic from the existing road, that has heavy gradients, over to this new railway, which is running parallel to it?—Yes, and incidentally to open up some new country.

514. Transferring the trains you have on that existing railway over on to the new one?—Yes.

515. And there are only ten one way and seven another?—Yes.

516. It does seem a very thin traffic to justify automatic signalling and provisional loops, and so on?—Might I suggest you ask Mr. Hodgson on that point.

517. But if you would give us your costs we should be glad?—Yes.

518. What was your estimate for the pneumatic-electric signalling in Sydney yard—This latest job?

519. Yes?—I cannot give you the exact figure from memory. It is rather a misleading figure, because it is something which is grafted on to the old system; it was not for a brand new system.

520. Whatever it was, it cost a certain sum of money?—Yes, I can give you exactly what it did cost.

521. Was your estimate anywhere near the actual figure?—No, it was not, it was very much below. There were so many contingencies arose in carrying it out.

522. You were a wise estimator?—No; the estimate was much below the cost of the work.

523. I thought it was the other way?—No.

524. What part of the work, that is, the appliances, did you manufacture in your shop?—Of the new work?

525. Yes?—The whole of the interlocking machine; that was really the biggest job, and the additional shunting signals, which are now electric, the small ground signals, which are worked electrically.

526. All that work you manufactured in your shops?—Yes.

527. You did buy a good deal of it outside, did you not?—What I had chiefly to buy were the alternating current relays, which we have not succeeded in manufacturing yet. We have been preparing for electrification by installing the track circuit alternating current instead of direct current, and the large number of alternating current relays which we use really were all imported, with the exception of a few we obtained from Melbourne.

528. Are those things patented?—No.

529. You can buy them anywhere?—Yes. We are now getting very good alternating current relays from McKenzie and Holland, who manufacture them in Melbourne.

530. Was that the principal part of the things that you bought outside?—I think it was, in money.

531. Have you a running contract for any of these things?—No, we have only a running contract for things like insulated wire, but for special articles we call for tenders each time.

532. Do you have to pay any patent fees for those things you are manufacturing?—Not now. The only things that we ever paid any fees on were the block instruments, on which we paid for a short time, and an

electric signal reverser, which we use now, but for which we no longer do so. I think I am right in saying that we have not a single article that we pay fees on now.

533. All the things you buy are in the open market?—Yes, and the large majority have been developed in my own place, and therefore there is no question of patents.

534. You claim that your signalling system, that is the indications of the state of the line and so on, the signal arms and quadrants and so on, are very simple. You have rather departed from the semaphore, have you not, with regard to your electrified lines?—The only departure from the semaphore is in the adoption of the daylight colour signal, which has only been adopted to a very small extent.

535. I thought you had departed from it in other directions?—No, I think not.

536. It is only in your daylight colour signal?—Yes.

537. There are no indications apart from the red and the green lights?—No, none whatever. They give by day exactly the same indications which a semaphore gives at night. I cannot think of any departure.

538. You will agree that, from the driver's point of view, the simple thing is the best thing?—I do, indeed, and that is what I always aim at.

539. (Plans produced): What are these things?—Those are the old pattern independent discs which turn round.

540. On the ground?—Yes. They were in almost universal use when I came here, but we are gradually getting rid of those in favour of the dwarf signals. The dwarf signal has exactly the same indication as the high signal. Those discs are disappearing.

541. You did not say in your report that they were disappearing?—Yes, I think I did, but for many years they will still be there.

542. We may take it then, may we, that all your signals now are in that shape, whether they are for shunting, wrong-road signals, or anything else?—They will be, but they are not now, because many of these turn-round discs do exist, but they will be done away with as the process proceeds.

543. What are these?—They are glass-enclosed electric signals. They are all still carrying out the semaphore idea. They turn up and down. In this case they turn up. This particular one here is for a turn-out.

544. It is a ground signal?—No, that is on the same bridge that carries the main semaphore. We use this at complicated junctions where we do not want to multiply the number of arms in the way of bracket signals. The main road is given by that semaphore, and if the turn-out road is set this small arm also assumes the upper quadrant and the letter indicating the road appears there.

545. What happens to that?—That still remains in the stop position. This particular one was devised for the Illawarra junction, near Sydney, as formerly there were four arms in a row, and now you merely get the main arm with its light and the turn-out arm.

546. What is the turn-out?—I mean the slow-speed junction—the turn-out from the main line.

547. Would not that have been equally well met by a semaphore in that shape on this same post?—What, underneath it?

548. Yes?—No, that would be absolutely contrary to modern practice. That is the very thing I have been endeavouring to get rid of—the old method of having a branch signal on a lower arm on the same post, because we found it was confusing, and not only so, it interferes with this light. The standard principle is that the two lights are used in combination to give the caution or the all-clear position. If you have an arm with a junction signal underneath there you immediately arrive at the position that you have two red lights at night, meaning two different things.

549. I dare say your drivers, when they have to run to these signals, get acquainted with them, but there is a

Witness—C. B. Byles, 15 July, 1924.

great value, I think you will admit, in having the same shape of signal for all things?—That is so, and that is the very thing I am aiming at. I pride myself that a driver who has never been over the line before can read the signals with perfect ease, and particularly that is so at night when the conditions are most difficult, as he always finds the same lights meaning the same thing.

550. Those are your daylight signals?—Those are the daylight colour signals, and there again there is exactly the same indication.

551. What is your indication there for your turn-out?—We should have the same thing at the side for the turn-out in that case, and then the colour signals would take the place of those semaphores.

552. These daylight signals you would apply throughout the whole of the city railway?—Oh, certainly, in the tunnel.

553. You have the same form for siding and shunting movements in your electric zone?—These are where electric power is available.

554. Have you ever had any trouble with drivers running by these signals?—Never to my knowledge. The drivers like them very much. Of course, they are only for short range, for shunting movements.

555. Sir VINCENT RAVEN: Are these daylight signals more expensive than the others?—No, on the contrary they are cheaper. The current consumption is very small. In practice, even in the electrically-lighted areas, we keep the lights going practically always, except just in the areas of interlocking, because it does not pay to switch them out.

556. If it is cheaper, why do you not carry it out on the road wherever you have electric light?—I think it will come to that. It is quite a new feature, the daylight colour signal.

557. You mean here?—Or anywhere.

558. I beg your pardon, it has been for years and years over in America. I saw it there fifteen years ago.

559. Sir SAM FAY: This is in duplicate, I suppose, as far as the lights are concerned?—No, we do not usually put in a spare lamp.

560. What happens when one goes out?—There are two filaments. The lamps are double filaments, but they are under run, that is to say, we have a voltage less than the rate of the lamp so that the burnouts are very very rare.

561. At page 19 you say, with regard to your material required, that the District Inspectors issue requisitions for materials they they require, and this, after being countersigned by the supervising officer—who is the supervising officer?—That is the outdoor assistant to whom you referred at the beginning of my examination.

562. It comes back to your outdoor assistant?—It comes to him and he approves it.

563. All the block instruments are manufactured in the Chief Electrical Engineer's workshop?—Yes.

564. Then the staff instruments are manufactured in your shop up to a certain point, and then you send them over to the Chief Electrical Engineer and he finishes them?—He does the coils and the electrical parts. If you wish for a description of Sydney yard I have it here.

565. No, I do not want a description of the yard. What I asked for was your estimate and what it has actually cost?—I have taken a note of that.

566. Sir VINCENT RAVEN: We have not had an opportunity yet of having a look at your workshops, but I understand you have some?—That is so.

567. They are close into Sydney, are they not?—Yes. One is in Sydney yard and another one is just at the back of the station at Eveleigh, and the concrete works are out at Auburn, about 10 miles out.

568. And do you propose to transfer your shops to another place which I have not had an opportunity of looking at. They are going to put down other large manufacturing shops at Chullora?—Yes.

569. When you go there are you going to be as self-contained as you are at present?—Practically, with the exception that it is intended to put up a large central foundry there which will serve the shops all round.

570. You do not propose to do any foundry work?—Not ironfoundry work.

571. Why brass foundry work?—Of course, that is a very small matter, the brass foundry, and I have a great demand for small brass castings, and probably we can do them more cheaply or quite as cheaply as in a central foundry.

572. Do you not believe in centralising similar work?—On general principles, but my experience of obtaining castings from a central foundry has not been very happy in the past.

573. You would always have a cost given you, supposing you were ordering your brass castings from the Chief Mechanical Engineer; he would give you a cost?—Yes.

574. And if you could do them cheaper outside you would question that cost?—The difficulty has not been in getting the cost, but the material.

575. He would not supply you?—There would always be a difficulty. My stuff is always very very small, and a large foundry does not care for small stuff. My average article cast is about 15 lb.; the very heaviest article I have does not exceed 2 cwt.

576. Well, I would not call that small?—It is for a loco. foundry.

577. Oh, yes, the average, but there is plenty of work which is very much smaller than that?—I have things down to half a pound.

578. But the point is that they can do the work, and if it was done at one central place it would be more economical than having it done at separate places?—Yes, as I have said, that is the ultimate idea, and the Commissioners intend to do that ultimately.

579. You led me to believe that, so far as the brass castings were concerned, that they did not intend to do it?—I do not think so. It has never come under review.

580. I thought you said simply the metal?—Simply the iron castings; that is, as far as I know. Perhaps you know the Baby Schwartz furnace; and it is a very economical arrangement, and there are really no overhead charges there which need to be distributed. I am doing brass castings for about 1s. 3d. per lb.

581. I am not talking about any particular method or any particular cost, except the centralising of this work?—The Commissioners fully intend to do that, I know; the Chief Commissioner has spoken to me several times about it.

582. All foundry work?—Yes.

583. Is there any reason to wait until you get to these new works?—The central foundry does not exist at the present moment.

584. You have a much larger foundry than they can find full work for even at the present moment?—If that is so, I suppose they could handle our stuff. I used to get a good deal from Eveleigh at one time.

585. But they have increased their foundry very considerably in quite recent years so they tell me?—Yes.

586. With regard to the pattern-making and woodwork does not the same apply?—Of course the pattern-making has to be kept in close association with the drawing office; and the pattern work has been specialised in for so many years, the men are well accustomed to our type of work, and I should anticipate great inconvenience from having to be dependent on other people for pattern-making.

587. Is that purely sentimental?—No, I am afraid it would be quite the reverse of sentimental if the actual thing came about.

588. You do not mean to say that if you give the drawings, and you give the order, that they cannot do it quite as well as you can do it in your shops?—Oh, I suppose they could.

Witnesses—C. B. Byles, 15 July, and C. A. Hodgson, 16 July, 1924.

589. Then it is rather sentimental having it done under your own eye?—And there is the question of convenience. Everybody likes to be able to control their own work, because you can get at the man who is to blame then.

590. I know so much about that; that is why I am asking these questions. Everybody likes to do their own work themselves?—Yes.

591. But that is not saying, given the full drawings and the specifications of what you want doing, that it should not be done equally well by another competent person?—I suppose so.

592. And centralisation do you agree is economy?—I suppose it is; it must be up to a point.

593. How many men do you employ now in your works?—About 400, roughly, in the shops altogether. Would you like me to give you the actual figure? The workshops wages staff is 451.

594. When you all get together at Chullora, would you feel inclined to raise objection to centralisation of a good deal of this work? There is tinsmith work, and surely your tinsmith work could be done in the shop where they employ ten times as many men as you employ?—Of course it is a very difficult question to answer.

595. I only wanted to get at this, whether you had in mind any particular reason why it should not be done at a central works by, of course, competent people?—Perhaps I can only answer it in this way: I have had experience of both systems; I have had experience of having to be dependent on other people for my supplies, and I now have the experience of having them all under my own hand, and naturally I should regret having to go back to any system where I should be dependent upon others, having suffered so much from it in the past.

596. Sir SAM FAY: Would you be kind enough to send us in the information with regard to your estimates for Sydney, and your Molong-Dubbo line?—Yes.

597. Sir VINCENT RAVEN: In connection with a new line which is really opened out for pioneering purposes,

and is going to have very little traffic over it to begin with, do you equip that with a cheaper signalling arrangement than you would another line which you expect to have a large amount of traffic over it?—Yes, that is so. I have here a diagram showing the way we grade the signalling. As you will see there, the lines are graded. [Diagram produced.] This is the very simplest scheme on a surface line where there is nothing but a mixed train service.

598. Those are all hand-worked?—Yes, on the ground. We just put a single signal. Then we go a step further on more important lines, but we still work them on the ground, only providing more signals, and on a heavy main line we go further, and connect up the points to a central control.

599. Sir SAM FAY: In your simplest form you have no distant signal at all?—That is so.

600. Sir VINCENT RAVEN: I do not think we have got any costs from you other than what we get out of the half-yearly report?—I have them all here with me if you would like to see them. You mean the cost of maintenance and capital expenditure?

601. Sir SAM FAY: You might send those in when you send in those other figures—The loan vote expenditure?

602. Yes; how much you have spent during the last six or seven years?—I have the statement back for about ten or twelve years.

603. Sir VINCENT RAVEN: Perhaps you would arrange to show us around your shops some day?—I should be very glad to. You would like to see them all. The show place is the season-ticket place; that is also at Redfern.

604. That is quite close?—Yes.

605. We should like to have a look at that?—Very well.

(Witness retired.)

(The Commission then adjourned.)

#### SEVENTH DAY.

WEDNESDAY, 16 JULY, 1924.

(Held at Chief Secretary's Building, Macquarie-street, Sydney.)

#### COMMISSIONERS:

Sir SAM FAY.

Sir VINCENT L. RAVEN.

CHARLES AUSTEN HODGSON, Chief Traffic Manager, N.S.W. Government Railways, sworn, and examined as under—:

606. Sir SAM FAY: We want to get this evidence put into the proper form, and I think the best thing we can do is simply to put the questions to you, and you give the same answers as you gave before, provided you do not alter the context.

607. You have been here a long time, on the railways in New South Wales?—Yes, thirty-four and a half years.

608. You have seen the thing grow from a comparatively small mileage to what it is now?—Yes.

609. Has the organisation been the same throughout?—No, there have been a number of changes.

610. But it has always been centralised control from Sydney?—Yes, but for many years the line was divided up into two parts, and there was an officer in charge of each section; one was the North and West, and the other was the South and South Coast, including the metropolitan.

611. And those were under two distinct officers?—Yes. They were called Outdoor Superintendents in those days.

(Owing to defective transcript the first part of this evidence was recapitulated on 25th July, 1924.)

612. But they were under the Chief Traffic Manager?—Yes, nominally; at the same time, the Commissioners used to deal direct with them.

613. What were they called?—They were called Outdoor Superintendents.

614. Would they control their divisions?—Yes, for all traffic purposes. Of course, there were District Superintendents under them.

615. That is practically the only change that has been made?—Yes. One of the positions was abolished, and there became one outdoor superintendent, who took all the lines.

616. Practically, it has been centralised control?—Yes.

617. Now you have got to-day a system of railways which, taken from the Queensland border down to the Victorian border, is roughly 1,000 miles, and you go from Sydney to Bourke, 500 miles?—Yes. Brewarrina is the furthest station west, 523 miles.

618. Then up to Murwillumbah—that is what?—579 miles, if you take it by way of Grafton, but that, of course, is not linked up yet.

619. Have you ever made any suggestion to the Commissioners that there should be decentralisation?—No, I

Witness—C. A. Hodgson, 16 July, 1924.

have not given it any consideration, because I knew that the policy of the Commissioners was the reverse.

620. You have under you four assistants?—Yes. On my personal staff I have three outdoor assistants; and of those three assistants one takes the north, one the south, and one the west.

621. And their duties?—Their duty is to travel about the line, to closely watch the working and the conditions, and the operation generally, to interview the District Superintendents with a view to any improvements they may think possible with regard to increased facilities, or in connection with delays that want cutting out. I expect them to cure any matters that want curing, direct, if they can; if they cannot, then they have to refer them to me. I meet these three officers once a week—I have a meeting every Monday, at which these three outdoor men are present, and I hear from them briefly what they have been doing during the week, what they have seen and done, and I receive from them any suggestions they may have to make.

622. In addition to that, I understand you have District Superintendents' meetings?—Yes, I have. The District Superintendents meet once a month. There is also a conference held in Sydney once a month with the assistant District Superintendents.

623. And your outdoor assistants are present at those meetings?—At my monthly conference, yes. I might add that I do not take the chair at the assistants' meeting; that is taken by the Superintendent of Goods Transportation.

624. Now, with regard to rates; you have a Goods Superintendent?—Yes. He is under my control. He takes a considerable part in the mercantile work up to a certain point.

625. But he does not quote the rates?—No, sir.

626. Now, as to the supply of engine power; who is responsible for that?—The Superintendent of Goods Transportation looks after the engine supply.

627. That is for goods traffic—For goods traffic, yes.

628. With regard to the supply of engines for passenger traffic, how is that dealt with?—That is done entirely by the Locomotive Department.

629. You have no control over that?—None whatever.

630. Your passenger trains are all rostered?—That is so, and of course, the time-tables are agreed with the Chief Mechanical Engineer, and he supplies the engines for them without further question.

631. But the allocation of goods engines is another matter?—That is another matter; that has to do with me. I have to see what engines are required at any particular depot.

632. And you arrange to keep the different classes together as far as you can?—As far as is possible, because I know it is a better arrangement from the locomotive point of view. Of course, I have to be guided by the traffic which has to be conveyed, and it requires frequent alteration as the flow of traffic alters.

633. You confer freely with the Locomotive Department in connection with the supply of engines generally?—Oh, yes, I always confer with them. But if their requirements do not meet my traffic requirements I have to look after the traffic; it has the first consideration.

634. When engines are taken away from their home depots—that is to say, when they cannot get back on the same day, for traffic reasons—does the Locomotive Department know that they are being kept out?—Yes. They would know what the run was to the engine, they would know where it was going to, and whether we could get it back or not. Apart from that, there are cases, of course, where we might be compelled to take an engine when it was away from its home depot and send it possibly further off still, if we had a shortage; in that case it is for us to

see that the engine is brought back to its home depot at the first opportunity. We do not do it unless we are compelled to do it.

635. If a station-master in the middle of the night ordered an engine away for some special reason, the District Superintendent would have a knowledge of it?—Yes.

636. And he would communicate with the Locomotive Department?—Well, the stationmaster himself would.

637. The station-master direct?—Direct; but he would also advise the District Superintendent of what he had done.

638. As to the work of the District Superintendent at night, when their offices are closed, what happens to that?—That is conducted by the station-master at the depot at which the District Superintendent is located. He is responsible either for giving the necessary instructions, or for obtaining instructions from the District Superintendent, or one of his officers. I mean to say, a staff matter might arise during the night, a question of relief, and in that case the depot stationmaster would ring up the staff clerk and ask him for instructions. In regard to traffic working, the depot station-master would give the instructions, provided he knew what to do; if he did not, he would communicate with the District Superintendent.

639. You have an accountant;—what does he deal with?—I have not an accountant. My accounts, which are confined to wages, and so on, are dealt with by my staff branch.

640. Your accountant has nothing to do beyond that?—No. He merely deals with wages, salaries, stores, and debits from other branches.

641. You say something about water supply for traffic purposes. I suppose that is simply a question of seeing that provision is made for water supply—it does not mean that you provide it in any shape?—Well, not exactly. As a matter of fact, many times in the year we actually have to supply water to our people for their use. We have to take it by water train, and we have to see that the facilities are there for taking it.

642. Your superintendent of goods and live-stock transportation is responsible for the supervision of the goods trains generally, is he?—Yes.

643. And he is responsible for the loads of the engines for the goods trains?—Yes.

644. He is situated at Sydney, is he?—Yes. I meet him every morning.

645. Among the items you have in your list I see this: "The mechanical staff determine if engines are fit for the service for which they are intended." Does that mean that they are examined continually by the mechanical staff, or do you send them away to an out depot for a week or more, away from their own depot, and they get practically no attention?—No. If they go to an out depot they should be treated there the same as if they were at their own depot. The mechanical staff have to advise whether the engine is fit for the road or not; we have no control over that.

646. Then you are advised by the Locomotive Department of the number of engines that are available for traffic purposes for each depot?—That is so.

647. Does that mean that they tell you the number of engines that are in need of repair out of the total you have allocated to a particular depot?—Yes, but that only refers to running repairs, not to general repairs. We might have sixty engines allocated to a certain depot, and possibly fifty of those are at the depot, and the Locomotive Department advise us that forty-five of those are available for the road, and that the other five are undergoing what they call running repairs. I might add that they put them in different classes, according to the time they are going to be under repairs. We have their lists of A, B, and C classes; the A class would be ready for traffic within 12 hours, the B within 24 hours, and the C are indefinite.

648. With regard to the loadings of the trains for all the sections of the railway, you work in conjunction with the Chief Mechanical Engineer?—That is so.

649. And he signs the loading table?—That is so.

650. In conjunction with yourself?—Yes.

651. With regard to locomotive coal supplies, do you deal with that?—Yes; my superintendent of goods and live-stock transportation deals with the regulation of it. Very often we do run special trains for locomotive coal, especially in connection with Eveleigh—we have a special type of waggon which is used there.

652. Are they under the control of the Chief Mechanical Engineer or of you?—They are practically under my control. I supply them to the collieries. I am responsible for the keeping up of the coal supplies to a proper tonnage, but I do not do the actual ordering of the coal, though I have the lifting of it. The Comptroller of Stores decides on the quantity to be supplied by the mines. The actual order for the coal is given by him, but it is my business to bring the coal in proper quantities from the mine to the locomotive depot, where it is required.

653. Taking your passenger transportation business, who controls that, under you?—The superintendent of passenger transportation; he is located in Sydney.

654. And how far do his duties extend?—Right throughout, in connection with passenger traffic, for the whole system.

655. He is responsible for the time-tables?—Yes, he is responsible for the compilation of the time-tables. The time-table officer is under him; he is also responsible for the supply of coaching stock.

656. Does he do any commercial work?—Practically none. He controls the sleeping cars and the whole of the carriage stock, and issues special train notices for the whole of the lines, for passenger traffic.

657. How far do the district superintendents come in in regard to that?—They issue local circulars with regard to the running of goods trains and stock trains in their own districts.

658. How about passenger trains?—Not passenger trains.

659. If they wanted a passenger train run they would communicate with your passenger superintendent?—Yes.

660. You say in a note that engine rosters for suburban traffic are examined jointly by the traffic and locomotive inspectors to ensure proper co-ordination and economy in the working. I suppose that simply means that the locomotive people confer with you, or with your passenger superintendent?—With the passenger superintendent.

661. Your salaried staff is roughly 3,000?—Yes.

662. That is in all your districts?—Yes, that is my total salaried staff.

663. What is your wages staff?—7,177.

664. Do you employ much casual labour?—Yes, we frequently employ casual labour—for example, to deal with the wool traffic. We give assistance in connection with that, mostly in connection with sheeting and the roping of the trucks. That is particularly so at many of the unattended sidings. We generally put a man in charge of the siding for the wool season, and he deals with the consignment notes. We find it saves us a lot of trouble. We also employ them in connection with stock loading, and we employ a certain number at Darling Harbour, in case of any unusual rush there.

665. You have established a control system on portion of the Illawarra line?—Yes.

666. But you have not adopted that elsewhere to any extent?—No. We only have the nucleus of a control here in Sydney; it is only just at the start.

667. Would it not be possible for your district superintendents to have a control office attached to their particular office, for controlling the whole of the traffic in their district?—It would be possible, with a certain outlay of money, but up till now it has not been considered that the expenditure would be warranted—certainly not in the outlying districts, where the traffic is so comparatively light.

668. With regard to your telephones, do you use those telephones for the ordinary business, or do you confine

them to engine working and the operations of traffic generally?—They are used for ordinary business. As a matter of fact, at many stations we have nothing but the telephone. We have the Morse telegraph, but that is only at the more important stations; most of the smaller stations only have the telephone, and all business has to be conducted over that.

669. So that you could not allocate your telephones entirely to control and manipulation of rolling-stock, including engines?—No, we could not. I am quite satisfied that we could not do that work on the existing telephones, with the present business, because generally speaking our telephones are pretty heavily taxed at present.

670. What was the cost of installing the control system on the Illawarra line?—I think it was £5,000.

671. And your intention is to establish a similar control, or an extended one, in the Sydney area?—Yes. We want to start it in Sydney itself, just close round, and then gradually extend it out from Sydney. Later on it would probably include the one at Thirroul.

672. That would include the new city railway?—Yes.

673. Could you give me any idea of what you have saved by the establishment of a control system?—About £11,000 a year.

674. Quite worth doing?—Oh, quite.

675. What do you consider your position is with regard to locomotives and rolling-stock as being sufficient for your existing traffic?—We have a shortage of locomotives for suburban passenger service, and we have as a matter of fact to use a fairly large number of goods engines on that service.

676. How do you hope to cure that?—When we get electrification. As a matter of fact, it is the fact that we are now engaged on the preliminary work in connection with electrification which has caused the Commissioners not to increase the supply of suburban steam locomotives.

677. With regard to goods engines, you think you have sufficient to meet all your demands?—Yes.

678. Even during a rush period?—Yes. Of course, we do occasionally get a little delay; that is, if perhaps an unusually large number may have been marked off for running repairs at a particular depot.

679. You say with regard to Main line coaching stock there is sufficient for all ordinary demands, but that the suburban stock is not sufficient?—No, it is not; as a matter of fact, we are using a fairly large number of Main line carriages, that is, side-door carriages, in our suburban traffic.

680. Again, you are awaiting electrification to cure that?—That is so. We actually have cars under order at the present time; they are electric cars, of course.

681. Then, with regard to live stock trucks, you say there is frequently a shortage of live stock waggons to meet your demands, and owners have to wait their turn?—That is so.

682. What notice do you expect to be given?—Under ordinary conditions, four days. But there are times when we have a shortage of stock waggons, and that is in time of drought, when everybody wants to move their stock at the one time. Of course, we cannot do it, and they have to wait their turn in those cases, because at that time we also have the fat stock to deal with.

683. In time of drought you would not only get applications for waggons to convey stock from an area suffering from drought to an area where there was feed, but you would also get applications for waggons for stock that people would prefer to kill rather than see them die?—That is so. As a matter of fact, when there is a drought people are more anxious to get rid of their stock before it gets into bad condition, and the result is that the number of fat stock sent to Sydney increases.

684. At the time of drought?—At the time of drought—the very time when they are wanting to move the other stock from pasture to pasture.

Witness—C. A. Hodgson, 16 July, 1924.

685. In order to meet that, you think you would want a considerable increase in your supply of cattle and sheep waggons?—That is so, and they would be of no use whatever except in time of drought; we might go, for example, for two or three years without a drought, and we should not use them at all.

686. Could you not make use of your ordinary goods waggons for sheep?—We do relieve the situation in that way. I dare say you may have seen, in travelling about, a number of high-sided waggons marked "Bulk wheat"; those are the waggons that we use for carrying starving stock; we use many hundreds of them when the pinch occurs.

687. But still, even with them, I take it you have not got sufficient rolling-stock to promptly deal with the demands in time of drought?—No, sir, we have not.

688. Have you a sufficient number of goods rolling-stock to meet your business?—Yes, practically we have.

689. Even when you get a good harvest?—When we get a good harvest there is always a demand for more trucks than we can supply, and though that has led to a certain amount of complaint it is really from one class of people, and that is not the producer, but the wheat agent; he is the agent of the man who buys; he is down in the country, and he works on a commission and gets paid a certain fixed sum per bushel, which includes the cost of stacking, and it is manifestly to his advantage not to stack, because he gets paid whether he stacks or not; the result is that his object is to rush all the wheat away in trucks to Sydney at the start of the harvest, so as to obviate the necessity of putting it in stacks.

690. Do you get any congestion at Sydney, awaiting ships?—Yes, but not so much now as we did, because we regulate the loading. At one time, when we did not regulate the loading—in other words, when we supplied the trucks that were asked for—I know of one occasion when we had between 3,000 and 4,000 trucks under loads down here, and we did not know what to do with them.

691. Assuming you had to find the necessary number of waggons to meet the demand during a drought period, would you prefer to have built live stock waggons, or would you prefer to have built goods waggons which could be made available for stock purposes?—Live-stock waggons.

692. Of the two, you would prefer an increase of live-stock waggons?—I would, sir. I do not want any more goods waggons; if I were to load any more I would only get congestion.

693. But, looking ahead for the next ten years, assuming that you get an increase in your wheat area, then you would want an increased number of goods waggons?—Undoubtedly so. We are building them now.

694. Would it, in your opinion, then, be better to build live-stock waggons which would only be required during times of drought, rather than goods waggons which would be available for both purposes?—Yes. A sheep van, of course, will carry very many more sheep than an open truck, because you have the two decks—and largely it is sheep we are talking about; the cattle is only a minor thing comparatively. We can get many more sheep away in a train load of sheep vans than in a train load of open trucks.

695. Still, if you had a surplus of sheep waggons for a drought period, you would have them out of use, probably, for nine months of the year; whereas if you had waggons available for wheat, which could on occasion be used for sheep, would not that be better than building the sheep waggons?—I do not think so, because we have at the present time, of course, a supply of waggons other than live-stock waggons which can be used, as a matter of fact, for carrying sheep.

696. I am looking rather at the future?—We are increasing our goods rolling-stock, our open trucks; we increase them every year to cope with the increase of business.

697. Now, with regard to coal; you say that there are times when the demand for coal hoppers to keep the mines going is in excess of the supply?—That is so. We only have a limited number of coal hoppers, roughly 1,500, and if trade is bad, or if for any reason there is a delay in clearing the coal out of the hoppers at the shipment point, owing possibly to the vessel not turning up, then we get a shortage. We have ample supplies to keep the shipping going, but we have not an ample supply to keep on keeping the mine going if they do not dispose of the coal.

698. You supply all the trucks for inland consumption?—Practically so, yes.

699. But the collieries supply the hopper trucks for shipment?—For all the shipment at Newcastle, and some at Sydney—some of the South Coast mines have their own hoppers.

700. You have given a statement of the waggons ordered and supplied each month, to the end of December, 1923, and I see that in October you had a shortage of 4,700 waggons, and in December a shortage of 9,000—you had altogether on order 89,000 waggons?—Yes, we had orders.

701. And you supplied 79,000?—Yes, and they did not load them. There was an alleged shortage of 9,000 waggons, but they did not load the waggons they got.

702. In one instance I notice that apparently they loaded more trucks than they got. What is the explanation of that?—That is in March, and you will notice that in March, April, August, and September the number shown there as supplied is the same as the number ordered, whereas in all other months the number supplied was less than the number ordered. On our returns we never show any supplied more than ordered, because they are not what we actually supplied, but if the trucks are not ordered, and the traffic offers, and trucks are available, we allow them to load them without ordering. In March I see that we supplied the actual number that were ordered, but we certainly loaded more than that, because we had a big surplus of waggons in March; we not only supplied every truck that was ordered, up to 82,000, but we had available more trucks than that at the station, and we permitted them to load them. As a matter of fact, the trucks available in March were over 100,000.

703. Can you give me any idea what the actual shortage is of waggons?—No, sir; it is a most difficult thing to do, because, as a matter of fact, we know that it is a common practice for people to over-order—in other words, to order more trucks than they intend to load. They have an idea that they may not perhaps get all they order, and so they purposely over-order.

704. That rather shows they have not much faith in your capacity to give them the trucks they want?—I think it is the aftermath from some years ago, when we had a shortage of waggons and were not able to supply orders in full, and had to give them a percentage. But our supply has since been put right.

705. Of course, you have had a very large increase in the mileage of your railways during the last ten years—something like 35 per cent.—the question is, has your waggon supply kept up with the increased mileage?—Yes, I think it has. We are certainly very much better off than we were a few years ago.

706. That may be so, but do you think, having regard to the future, that sufficient additional waggons are being built?—I think so.

707. That is, assuming they go on building in the next few years as they have been doing in the past?—The past two or three years, yes.

708. You centralise the distribution of your waggons in Sydney?—Yes.

709. And the district superintendents look after their particular districts?—Yes, they do. They only appeal to Sydney when they are short; of course, they also advise Sydney of any surplus.

710. And you consider you have sufficient waggons for your coal traffic, with the exception of the hoppers?—That

is so—the hoppers for shipment. They are largely used from the South Coast up to Sydney; we do use them for some other purposes, for instance, also for coke and for a certain amount of ore traffic.

711. In the Newcastle area the supply is provided by the colliery proprietors?—That is quite different; they have their own trucks; we do not have to supply them.

712. But you have, I understand, actually stopped the collieries for want of trucks?—That is so, we have. If the steamers are delayed they do not empty the trucks; they fill them all up, and we cannot do any more; we have to wait until some of the trucks are released. But we do not delay the steamers.

713. What do you charge in addition to your ordinary rate for the supply of a truck?—We have a different rate—I do not know that it is on any particular basis. We have one rate for owners' trucks, and one rate for departmental trucks.

714. Is that based at all on the value of the truck?—I do not know that it is worked out on a uniform basis. It is a rate that has been in existence for very many years; I have not worked it out, as a matter of fact.

715. You say that with regard to the working of your traffic you get unbalanced working; that is to say, you get more empty waggons one way than you do the other. I suppose that is seasonal, is it?—Yes, it depends on the season of the year. We may get a balance between Sydney and the country sometimes, just for a short time; just at present it is very fairly balanced; that is, taking into consideration the difference in the train loads. Of course, on the South Coast there is never a balance; there it is practically all empties one way and all loaded the other—all loaded up to Sydney and all empties back. But on the main southern line, in the direction of Albury, that is where there is a balance just at present. Of course, we never exactly balance, but there is not much in it, except at harvest time; that is when we get a very big increase in the up traffic and no corresponding increase in the down traffic.

716. With regard to rail motors; how many have you actually at work at the present time?—Two. There are two others which are not running.

717. What has been your experience of them, from an operating point of view; have they done everything you anticipated?—Yes, as far as the performance of the motor is concerned, when it runs. But they have not proved a very good proposition as far as paying is concerned; we are disappointed with them; they do not seem to have increased the traffic much. On one line, the Holbrook line, for example, we doubled the service there, and practically we have hardly increased the business at all; that is to say we run there and back twice, from the junction station, in place of the old mixed train once. It has been a great disappointment.

718. Do you really expect to improve it very much if you only run a motor up to the end of the branch line and back again in a day?—It is going to improve the service very materially, because up to now we have used them for taking the place of the mixed train, which of course was a very slow means of travel.

719. The only thing you have given them is the increased speed?—Yes, that is really what it is; it saves them the delay at all wayside stations shunting.

720. As a matter of fact, on most of these country branch lines you do not give a passenger the opportunity of travelling to the nearest town for the purpose of seeing a doctor or dealing with legal business, or anything of that sort, and returning home on the same day?—That is so. Of course, in many cases the branch lines are too long for that purpose; we could not get there and back in the one day—that is, with the one motor.

721. Do you not think you would improve the amenities of the country districts if you ran more frequent services of passenger trains on these branch lines?—I do not think I would get very much increased business if I did—not

on the branch lines. I think there is a field for it in connection with the districts around the larger market towns—perhaps of getting people to go in to business and back home. But I am very doubtful about these branch lines.

722. At any rate, at the present time you have not got sufficient motors to supply the whole of your branch railways?—We cannot provide them in connection with the business of taking people into their market towns. We got them really in answer to a demand that came from the country people to expedite the rate of travel over these branch lines—to do away with the mixed trains, in other words; every motor we have had so far has been used for that purpose.

723-4. Did you get out the cost per mile of these rail motors?—I am not responsible for the figures.

725. Supposing you improve these branch line train services by putting on an ordinary locomotive engine—the locomotive would be of more advantage than a motor from the traffic point of view?—I do not think so.

726. Could you not use it for shunting purposes or the attaching of two or three vehicles?—It would cease to be a passenger train then and become a mixed train.

727. I am talking about stock. A good deal of complaints about trucks for sheep and so on have been received?—Not as a rule.

728. You have had serious complaints of delay?—We have had complaints about delay in connection with cross-country movements of trucks.

729. That is what I meant. Take two or three trucks. You have special trains where you get a load for a special train?—That is so.

730. If you only got two or three trucks, it has to take the chance of the service running?—We always try to amalgamate it where we can so as to put it on a fast run, where we have a reasonable load.

731. You may not have a reasonable load?—Fifty per cent. is a reasonable load. Apart from that, it has to go by ordinary through goods train. These are not the cases where we get the complaints. The complaints are about the cross-country routes.

732. To the markets?—Not to the markets. You may get it down to the junction station and then wait for the branch train.

733. You have given me here the number of telegrams sent in a month with regard to waggons and engines, and so on. It does not look very serious. What is your general scheme of organisation of your passenger trains? Do you first of all settle your interstate expresses and then make all the other trains revolve round them?—Largely that is so.

734. And then you fix your mail trains?—They are largely fixed by postal requirements, and that is why the mail trains leave Sydney in the evening.

735. All your other services are practically dependent upon the running of those mail trains?—Yes.

736. You try to make connections with them?—Yes.

737. These interstate trains are fixed by a conference—the running of them?—I think they were originally fixed by correspondence. We had to agree to the times.

738. And to the fares, too?—Yes. They are arranged by the interstate conference.

739. Those trains are being run at a speed, roughly, of 36 miles per hour?—Yes, that is including stops. That is much the same speed as the other States run theirs—that is, from Albury to Melbourne. The Queensland trains are slower. They have different conditions.

740. In the case of New South Wales, the times of the running of the trains means that you have to provide for the night?—In every case. We have to supply sleeping berths and sitting accommodation.

741. What notice do you expect to receive to give a ticket for a train to Melbourne?—We do not expect any.

Witness—C. A. Hodgson, 16 July, 1924.

742. What does a passenger expect to get if he only gives a day's notice? Does he expect a berth if he goes down to-day?—Yes.

743. He does not get it?—In some cases.

744. Do you really know?—Yes.

745. Would you be surprised to know that to-day you cannot get a berth under several days?—I would be.

746. I suggest you send someone down now to your tourist bureau, to see what time you can get a berth either for Melbourne or for Brisbane to-day. Assuming there is a delay in getting a sleeping berth, does that apply to seats as well?—No. With regard to berths, we have a certain number of cars normally on the train. If they are all filled and then another applicant comes we do not give him a berth, but we note his name. We say to him, "If sufficient people come along to warrant putting another car on we will put it on and then we will give you the berth." We do not run a car with only one passenger. If sufficient people apply we will put on another car, or several cars. Our trains are made up with a certain number of berths. Frequently we have to run another train. That would be in the ordinary course of things.

747. Are you doing justice to the service between these three capitals of the States, Sydney-Melbourne, and Sydney-Brisbane, under existing arrangements? Would you find a state of affairs, in your knowledge, anywhere else where the passenger cannot get within three or four days a sleeping berth if he wants it?—Of course, there is an alternative, to take a berth in the second train, the 7.50.

748. Are you running two night trains?—Every night, and very often three.

749. Do you mean to say there is an alternative sleeping berth accommodation?—Yes, on the 7.50.

750. And he can get that with certainty?—If the 7.50 is full and there was only one passenger, then he could not.

751. Supposing there were six?—Then we would put it on.

752. Do not you think you are driving them to travel by sea if they cannot get accommodation?—We do not find that. I know it is a difficult point to know what is a proper thing to do.

753. If these railways were run by companies, and passengers could not get accommodation, do not you think the Government would have something to say to the company which had a concession for running railways and did not provide accommodation for all the passengers who turned up?—I do not know. We are not responsible.

754. Not responsible from the carrying point of view? Practically, no. We take them by particular trains, providing there is room.

755. I am referring to a person who wants to travel and get a berth and gives you a day's notice?—That passenger can travel, but he cannot necessarily get a berth.

756. Are you sure he can?—Yes.

757. By sitting up?—Oh, yes.

758. Have you had any complaints from men who could not travel either by sitting up or by sleeping berth?—No.

759. You take a record of all the people who apply?—Yes. It is done through our own office. We take the names of the people who apply.

760. According to the statement you brought us, the speed of trains is 36 miles an hour, and freight trains 16 to 17 miles an hour?—Yes.

761. You run a considerable number of goods trains which are not printed in the time-table?—Special goods trains—yes.

762. Do not you think it would be an advantage to have a time-table for additional trains?—We have.

763. You have to some extent, but you have a number of cross-country, where you have not?—Yes, we have.

764. That would avoid the question to some extent of station-masters and others issuing notices of trains?—

There is rather a difficulty about it. It entirely depends upon what traffic you have to meet.

765. I am referring to a path for a train running through a particular district. Is it not better to have a path allocated for the train rather than to allow a station-master to send a train going at any particular time?—Each of the lines has its own table, and conditional trains are put down to run, showing all the crossings. When you are running a cross-country train one may not fit the other.

766. Still, there is a path?—Assuming you are running a train from north to south, and there are trains shown on the time-table running from south to north which are not running, then it becomes quite possible to make a very much better table for your north to south train.

767. You are referring to single-line running?—This is all single-line running. All our cross-country is single line, right from Werris Creek to Cootamundra.

768. You must get a good deal of delay?—We save a good deal of delay.

769. You can always provide for the alternative to make a path for a train?—All I said was, if it is laid down in the table, you have to make its path to cross all these other trains which are not running. If you issue a special table you avoid all those time-table delays.

770. Trains have been sent out at unsuitable times?—If the depot station-master makes out a bad table, then he has to answer for it. That is one of the greatest difficulties of single-line running. You have to lay down all the tables and you have to provide for the crossings. Many of these crossings do not need to be made.

771. That Molong-Dubbo line being made now is being constructed to get rid of grades more particularly?—Yes, it is for two purposes. It will become our trunk line. The existing trunk line from Orange to Dubbo will disappear, and the Molong-Dubbo line will take its place.

772. You mean, your main line to Bourke?—Yes.

773. It would not be your main line to Binnaway?—No, that goes off at Wallerawang.

774. You expect a good deal of traffic over that?—Yes. It is a very fine district, quite unlike the district that the existing line goes through.

775. You have only ten trains the one way and seven the other in the ordinary course?—Yes.

776. Do you get many special over there?—Yes. It entirely depends upon the condition of the country. There are times when we are drawing the whole of our stock from the west.

777. You look upon that as an important part of your main line?—Yes. It will open up a very fine wheat district, the line from Molong out to Dubbo. The other line should never have been built, as a matter of fact.

778. You have a meeting every morning, according to the memorandum you have given us?—Yes, every day except Sunday.

779. How long does that last?—It varies; generally three-quarters of an hour, but sometimes longer. We hold these meetings just after 9 a.m.

780. You hold a meeting every Monday with your other assistants, and you hold a monthly conference with your district superintendents, and the superintendent of goods and live-stock transportation?—He holds the conference with the assistants.

781. All this is a necessity of centralisation?—Yes.

782. It is taking a lot of people who have got their regular duties to perform away from their business at an important time of the day?—Yes.

783. Do you not find it rather inconvenient yourself?—No, I always go straight there. I do not come here first.

784. When you come to look through the number of meetings held, it represents a very considerable proportion of the time of some of your people, more particularly those who have to travel up from the country?—They only come once a month, the district officers.

785. They have meetings besides the one you hold?—That is done in their districts.

786. The assistants have to meet sometimes as well as the district superintendent?—Yes. They do not meet on the same day. They meet two days before the superintendents, once a month.

787. You consider the meetings a necessity of the present organisation?—Yes.

788. Do you ever look forward to any particular improvement in the times of the running of passenger trains?—We always hope for better things.

789. Is there anything in view which would give you better timing than you have? Take your interstate trains? If we could get rid of the locomotive trouble we would be very much better off.

790. You mean more powerful engines?—No. We do have a lot of trouble.

791. You mean more reliable?—Yes.

792. That does not affect the timing of trains. You are not giving them a longer time because you anticipate trouble?—No. The timing of the trains is regulated largely by the grades and the curvature.

793. Have you got 1 in 40 both ways from Sydney to Albury and Sydney to Wallangarra?—No, not 1 in 40 up from the south. It is 1 in 40 down. It is 1 in 40 from here to Albury.

794. What is the length of it?—There is a lot of 1 in 40. There are many places between Goulburn and Harden which are 1 in 40.

795. What about your northern line?—We have many miles of 1 in 40.

796. You want engines which will negotiate that with fair-sized trains. What number of passengers can you accommodate in your interstate expresses?—The limited express, which is all sleeping passengers, holds ninety. That does not take any sitting passengers.

797. That is full holding?—Almost always. There may be an occasional berth vacant because someone has not turned up.

798. That is your Melbourne train?—Yes.

799. That is not a bad paying service?—No.

800. With regard to other trains apart from the Limited. Do you run two or three as a rule?—To Melbourne?

801. Yes?—Yes, one other as a rule. There is a train which has a connection with Melbourne, the mail train, but there are practically no through passengers go by it. It is too slow and gets in at an awkward time.

802. There is a second train which is not limited?—Yes. Then there is a third train which runs, I should say, on the average, perhaps, four times out of seven. That is the 7.10.

803. Are all three of them sleeping accommodation?—Yes. The 7.10 would be both sleeping and sitting accommodation. The 7.25 is sleeping only and the 7.50 is both.

804. With regard to the north, how many do you run there?—Two to Wallangarra.

805. Is one a limited?—No, it really is not.

806. Do you generally get that full?—It is very fully loaded. That is not a sleeping train alone. That is the express.

807. It is looked upon as your recognised through interstate express?—Yes.

808. How many passengers do you get on that?—About 150.

809. Would you generally have 150?—Very near. We take passengers to Deepwater and Tenterfield. Those are the only two stations in New South Wales we take passengers to.

810. The greater part of the passengers go right through to Queensland?—They do. I cannot give the exact figure. It is first, second, and sleepers on that train.

811. Both those services are sufficiently well patronised to justify an extension if necessary?—They are quite good services.

812. Good paying services?—Yes.

813. You have to provide sleeping accommodation in both of these trains?—Yes.

\* 28910—C

814. With regard to the return services from Brisbane, does that mean sleeping on the New South Wales line?—Yes, and so it does from Melbourne, so that we get it both ways on both sides.

815. If anybody has any cause of complaint about sleeping they complain to you. It is no use going to Queensland or Victoria?—That is so.

816. You have given us a return of the percentage of trains to time?—Yes.

817. The percentage as a percentage does not look too bad. There are a very considerable number of important trains which are delayed per month?—Yes.

818. Do you get more delays with these expresses than with the other?—I think we do.

819. You must do to bring the average down. Your purely suburban train service does keep fairly good time?—Yes. They are shown separately.

820. The business trains morning and night keep fairly good times?—Yes.

821. Your through trains to the other States do not keep anything like good time?—Not as good as the suburban trains.

822. Nor as good as your country trains?—No.

823. Is that because they are running faster and you get more trouble?—I suppose that must be it. It is hard for me to say.

824. What is the principal cause of delay with these express trains?—Mostly locomotive troubles.

825. Engine failure?—Yes, or partial.

826. You apparently run a large number of trains as special trains in the Parkes district; you run 51 per cent. of your total train service as specials?—Yes.

827. June, 22 per cent.?—Yes.

828. That is taken over the year?—Yes.

829. A good many of those are water trains?—Yes.

830. Cannot you run those to time-table?—No. You never know what they are going to do. You have to ascertain the work they have to do on the road, how many camps they have to water. These are not trains running from one point to another. They are running to fill up the tanks along the line and stations. Some of our stations have to be supplied. They have a tank alongside, and it has to be filled by the train. It depends on what camps you have to water how you time your train.

831. You mean movable camps?—Some of them are.

832. If you have fixed camps you can make a regular schedule once a week or what is necessary?—It is a difficult thing to fix.

833. A special train running without a time-table; there must be delay?—The time-table is issued and all the crossings are shown. Occasionally a depot man will make a slip in his time-table, but no train is allowed to run unless the depot man has issued a time-table and notified the staff.

834. You seem to get a good deal of trouble with some of your staff. Do you get a very large number of men through your service?—They are always coming and going.

835. Do you find that your men leave the railway service?—Not to any great extent. There are a certain number we do not want. Some go out to better themselves and others of course pass away in the natural course.

836. It looks like inexperience more than anything else?—Many of the cases are. Many are through want of tuition.

837. That is inexperience?—Inexperience is at the bottom of it, but I always prefer to go for the man who ought to have told him better.

838. You have a note here that the Sydney limited ran to Albury fourteen times late and the up limited reached Sydney nineteen times late in one month?—Yes.

839. There are notes here of delays and troubles caused by the time-table issued by a night officer and other people. Do you not think that sort of work ought to be in the hands of a responsible official like the District Superintendent?—Those notices that are issued are often issued owing to the late running of a train.

Witness—C. A. Hodgson, 16 July, 1921.

840. Supposing your district superintendent has control of the whole area?—If they had control over the twenty-four hours they could do it, but they have not. That night officer would be a depot night officer, and he should know all about it. They are the picked men.

841. There has been some delay by transshipment of small articles where you have not got a truck load?—We do get complaints about that. We try to cure it as far as we can by limiting the loading to certain days.

842. Is not the delay at the transshipping point?—If we limit the loading days it means you can send many more through trucks.

843. That is three days a week for a particular area?—Yes, and then you get many more through trucks than loading all the six days.

844. There are six cases here noted of officers issuing notices for the running of trains. What would these men do with regard to engine power. Would they order an engine out?—Yes. In most of these cases the engine is probably already ordered out. They simply put it back on to the other times.

845. There is a case here of a depot officer cancelling a through train which had been fixed up by somebody else for stock, and he used the engine to return empties to another point?—Yes.

846. That would not happen if you had control?—No.

847. Most of the things I have extracted here refer to items of that character. There is a case where it is said improper time-tables were put out, and sometimes not a time-table at all. That would be cured if you had a superior officer in charge controlling his district?—It should be. When they speak there about no time-tables that perhaps does not convey what is meant. It means no detailed time-table. I think I remember that case. The depot station-master announced the train would leave his depot at a certain time and arrive at the next depot at a certain time, and he omitted to provide for a crossing which had to be made between the two depots.

848. Take the running of your live-stock trains? Are you getting satisfaction now that you have put on those fast trains?—Yes, from what we can judge and from what we are told.

849. It is a great deal better than it was before last December?—Infinitely.

850. Apparently you had a great deal of trouble with them before?—We did.

851. You put down in one of your minutes that 60 per cent. of your trouble was due to locomotive cases?—Yes.

852. Seven per cent. late loading, shunting 13 per cent., congestion at Flemington 7 per cent. Do you get very much congestion there, waiting to get into the yards?—Not a great deal.

853. There is a note here last April, with regard to some troubles you had in your working. You say, "In regard to engine-men on duty unduly early, Mr. Reid": who is he?—He is a District Superintendent at Goulburn.

854. The minute you made was: he said, "At one time the Department were allowed 45 minutes, and they now want 4 hours"—Is that for the preparation of the engine?—No, giving notice to the men, not to come on duty. It really means this: that they are booked up for a particular train. That train runs late and they want to put them back to a later time. The Locomotive Department says, "If you want to put these men back, they have already been called on duty, you will have to give us so much notice, otherwise they will book on."

855. You have a note about the light mileage between Singleton and Werris Creek. You do not get the proper class of engine, according to your own views. If you had had NN engines instead of the engines provided, the light mileage would have been reduced?—Yes.

856. It means you have not a sufficient class of that engine?—We had not at that time.

857. In making out the time-table for the country districts, do you have regard to the population of the areas

you are serving?—We have to regard the volume of traffic we are carrying.

858. What you might carry? Lots of these towns have from 5,000 to 8,000 people. You are apparently giving them one train each way per day in many instances?—That is so.

859. If you had sufficient rolling-stock, engines, and carriages and so on, would you run more trains?—Undoubtedly, within a certain distance of Sydney.

860. I am looking rather at the outer districts?—They do not seem to be a very promising field. We have tried it.

861. Would it not improve the amenities of country life if they had a better transport service?—They do not seem to think so. They do not patronise the train we give them. We gave them, for example, a passenger train from Cootamundra in the morning, a daylight trip to Sydney. Prior to that they had to travel by the mail at night, getting into Sydney at 6 a.m., and going home they had to go back at night and there in the small hours of the morning. We had a train running down as far as Harden and we extended it to Cootamundra. The traffic was so wretched we had to knock it off.

862. I was not thinking about that sort of service so much. I was looking at the people living out in the country areas wishing to get to their nearest town of any size for marketing purposes, medical attention, legal business, &c. They cannot go now unless they stay a day or so?—In many cases they have to stop there the night. I quite think there is a field there, and that is a field we hope to explore when we get more rail motors.

863. This is a State railway built for the development of the district?—Yes.

864. It is not like a company running for dividends, although the Commissioners are supposed to meet the interest on capital?—That is our difficulty.

865. I am looking at it rather from the point of view of what a company would do?—The great trouble has been that in most of these cases we could not make our working expenses.

866. You will find that all over the world?—We are not taking on those contracts where we do not make our working expenses unless they are forced upon us, which in some cases they are.

867. You know something about English railways?—Yes.

868. Do not you know that some private lines in England do not pay, and are not likely to?—Yes.

869. Still they run the trains?—Yes.

870. Five or six trains a day, very often on branch lines?—Yes. I know one very well, because I lived on it.

871. Your coal traffic is improving as compared with ten years ago in one or two of your districts?—Yes.

872. It has gone up from 7,800,000 to 8,200,000, 500,000 tons, roughly?—Yes.

872A. Your Illawarra line seems to be improving pretty fast?—Yes.

872B. That is where you are providing trucks?—Yes. A lot of the shipment coal from Illawarra is not shipped from Sydney. Most of the mines have their own jetties and they use their own waggons.

873. You have given a statement of tonnage of locomotive coal and other railway stores as compared with your paying tonnage. You say, "On service tonnage, exclusive of tonnage carried on department trains, £1,900,000." What do you call department trains?—Ballast trains; that is, traffic hauled by our ordinary goods trains. This means you have hauled 1,900,000 tons of coal?—Or other material, including ballast.

874. By your ordinary trains?—Yes.

875. It does not include trains running specially for ballast purposes?—No.

876. Is there any debit against the other departments for that?—Yes, we debit them.

877. You debit the Locomotive Department for coal?—I am not sure whether we get any credit for locomotive coal. I can get that information for you.

878. You will supply it to-morrow?—Yes.

879. And any coal or any credits you get from other departments we should like to know something about?—We get a fixed sum per mile; I think it is two-fifths of a penny from the Construction Branch.

880. You get credited by the engineer for ballast you convey?—I am not certain about that. I will have to find that out.

881. You have given a statement showing your claims?—You seem to pay a good deal for losses. Does that mean actual losses, goods going clean out of sight?—No. They may be destroyed through being so damaged.

882. Otherwise it does not seem to be out of the ordinary course. Do you get a good deal of complaint with regard to your interstate fares being on a lower basis than your local fares?—Yes.

883. Are those fare you agreed with the Victorian and Queensland Governments divided on strict mileage?—Yes.

884. You get the same per mile as the other people get?—Yes. With regard to fares or rates, there is a clause that rates and fares should be divided on a mileage basis, providing that no State gets more than its local fare.

885. You get a good deal less?—We do. That is a provision; you cannot take more. If your mileage proportion gives you more than your local charge the other State will take it.

886. You get applications from the country districts for berths in your through trains to Queensland and Victoria?—Yes. We wire to Challis House.

887. Is there any chance of people getting into the Limited?—It all depends on when they apply.

888. Would you hold a berth empty to a stopping-place between here and Albury?—Our Limited does not pick up anything. It only stops for locomotive purposes.

889. How about your second train?—That is different.

890. Do you hold the berths here for that?—We have to.

891. Do you get many complaints they cannot get them?—I have not heard of many.

892. The complaint is—it is not only a difficulty in getting a berth; it is a difficulty in knowing whether they have got it or not?—I think I know what you are referring to, particularly on the north. There we have three sleeping-car trains. We have the Glen Innes mail to Sydney, the Brisbane mail from Wallangarra, and the Brisbane express. What the people want is to travel by the interstate train, although they have a train of their own. They want to be allowed to book a berth from a station in New South Wales to Sydney in preference to a man coming from Brisbane. We say, "No, you have your own train; travel by it." They want to go by the interstate train. You can only go by it, providing no interstate passenger wants the berth. They say they do not know whether they are going to get it or not. That is true.

893. Do they know that in their own train?—Certainly.

894. Is it as good a train as the interstate express?—It is not as fast.

895. Is it as well appointed?—Practically the same.

896. Sir VINCENT RAVEN: Are they both trains people would take if they were going through to Brisbane?—Yes, the bulk of the people go by the express.

897. Sir SAM FAY: You have a train which serves the area, apart from your express?—Yes. The 2 o'clock train from Sydney is the mail, and the 3.30 is the express. They both connect at Wallangarra with the Queensland train.

898. It is really a question of accommodation on the train?—They are both the cabin type cars.

899. Sir VINCENT RAVEN: If a person wanted to go through to Brisbane, they would prefer to go through by the best train?—That is so. That is what we are insisting on, that the berths shall be kept for the through traffic, and not sold to local passengers unless they are going to

be vacant. It is largely on the up-journey the trouble is. They want to join the train at Tenterfield, and they want to be able to book a berth in the express perhaps a week before. We say, "No, you go in the mail." They say they do not want to go in the mail, and we say, "You cannot go in the express until we know what berths are wanted."

900. Sir SAM FAY: What time of the day or night do they leave there?—Half-past 6 p.m.

901. Is that the express?—Yes.

902. What time does the other train leave?—About twenty minutes later.

903. Why have they got a grievance because they cannot travel in the express?—They like the express.

904. What difference is there in the arrival time?—About an hour.

905. You have practically no day train at all, taking your trains south to Albury?—A day train to Cootamundra, but not below Cootamundra. We have the paper train, a mixed train, which has several passenger carriages on, which runs through to Albury, getting there at 10.35 p.m. That is no good from Sydney, because it leaves at 1.50 a.m. It is a good train from Goulburn, and lots of people travel by it.

906. Supposing you had the traffic for a couple of more trains from Sydney north, and two more trains south, both ways back, have you the stock to do it?—No.

907. Then you are limited to improving this accommodation by want of stock?—That is so.

908. I am asking you, if double the traffic turned up day by day wanting to go to Victoria and Queensland you could not accommodate them?—No.

909. I suppose that is really the answer to the complaints. That is why people cannot get what they want?—In many cases the people want something we should not give them if we had the stock, because we know it would not pay. I am prepared to admit I would give some of the services if we had the stock.

910. You have to do a great many things which do not pay if you are to give people accommodation which is reasonable?—We always try to give them what we consider reasonable. What we consider reasonable and what they consider reasonable are two different things. We have on several occasions acceded to their request and given service, and then they would not patronise it.

911. You have a valuable paying traffic both into Victoria and into Queensland?—Yes.

912. And it would pay you to use every accommodation you can and the best you can to a paying traffic like that between the three capitals?—Yes, and we try to do that.

913. You do not think you are giving complete satisfaction?—The odd passenger who cannot get a berth has a grievance.

914. Do not they travel during the season, when there is a reasonable prospect of fine weather, by boat?—No; a certain number go by the boat, and always will.

915. We have a list of the complaints that have been sent in through the secretary of the Commissioners for five months. A great many of them are trivial. They show what the people are complaining about in regard to the railways. We asked for these to see, as far as we could, what people were complaining about. There are forty complaints of this type—of compartments being turned from first into second and second into first. Is that due to want of stock?—Not altogether. It is largely owing to the rise in the fares owing to the war. It has a tendency to throw the first-class traffic into the second. Our proportion has altered considerably.

916. You are getting less first-class than before you raised the fares?—Yes. We raised the fares in 1917 and subsequent dates. We have had several rises in fares. It has had the effect of diminishing the percentage of first-class passengers considerably. Most of the trouble spoken about is due to the fact that, to make the best use of our cars, we have to roster them on various lines, and the

Witness—C. A. Hodgson, 16 July, 1924.

conditions are absolutely dissimilar. A train, for example, may arrive in Sydney with ten cars on, four first-class and six second. That train is rostered to go out to another suburb, and it may require two first-class and eight second-class carriages. After that train has arrived our staff have to get into the cars and label two of those first-class cars second. We have had complaints. People who have been waiting on the platform for the train to arrive have got into the car before our man got in to put the label on. That is the difficulty.

917. There is no difference between the first and second-class carriages except you have a little more sitting room?—You do not get any more sitting room on the suburban lines. They are the same, except the cover of the seats. The additional charge is one-third more. In the country it is 50 per cent. In the country they do get more room.

918. Complaints about not being able to get berths, berths booked and not available?—We have had several complaints with regard to that. There have been errors made. We always follow them up. They are frequently there owing to telephone troubles.

919. There is one case here—sixty-one passengers not able to get sleeping accommodation on the North Coast line?—That was one excursion, I think.

920. There is another case, "Booked sleeper, allotted to someone else, berth booked and paid for but not allotted, difficulty in getting berths, wrong information given, inadequate sleeping berth accommodation, sleeping berth declined but given to another, insufficient sleeping accommodation for a lady, wife's berth given to someone else, berth ordered but not booked." There seems a good collection of that sort of thing?—We have complaints from time to time about that sort of thing, both here and in Melbourne.

921. Passenger train service complaints. There are fifty-three items there. Some are quite trivial. They are, generally speaking, in the Sydney area?—Yes.

922. About the fares, the complaints mostly seem to be in regard to the booking clerks?—Yes.

WITNESS: I have that information you asked me for this morning with regard to the debits.

923. Sir SAM FAY: You might perhaps tell us that now?—Three-fifths of a penny per ton is the debit against the Construction Branch for any material hauled over the existing lines.

924. That is the Construction Branch?—Yes.

925. Does that apply to the Engineer for Existing Lines?—No.

926. It is purely new works?—New works, and we get credited in our revenue for that. With regard to tramway coal, that is debited. The cost of hauling that is debited against the Tramway Department's working expenses and it is credited to our revenue.

927. At what rates?—I have not got the actual rate, because it will vary according to the place it comes from.

928. Is it at the public rate?—It would be at the public rate, I think. That represents about £85,000 a year.

929. Public rate?—I fancy so.

930. Anyway, it is a credit to you for carrying coal for the Tramway Department?—Yes. With regard to locomotive coal, there is no debit at all.

931. No debit at all for anything you may convey either by special or ordinary train?—No. When we run a special ballast train we debit the engineer with the cost of guard's wages. There is a debit made also against the refreshment-room of a fixed amount, an estimated amount, but we get no credit for that at all. It is purely a book entry in connection with the refreshment-room account.

932. Sir VINCENT RAVEN: I understood you to say this morning that so far as the passenger traffic is concerned the arrangement of the locomotives was entirely in the hands of the Mechanical Engineering Department?—That is so.

933. I presume that is because they are all booked?—It is rather hard to say whether that is so or not. I might

explain, perhaps, by saying that some years ago the whole of the locomotives were under the control of the Mechanical Engineer as to their allocation and everything else.

934. I was coming to that. Up to 1913?—Yes, but owing to a difficulty that arose, owing to the non-supply of engines, owing to their being in the wrong place, the goods engines were removed from the control of the Chief Mechanical Engineer as to their allocation, and were placed in the hands of the Traffic Department, who had the information necessary to move them to the place where they were required.

935. But does it not come back to that, that where a train is booked and the working can be arranged beforehand, it is rather different from an unbooked train?—It is different. There is not the same fluctuation of business.

936. And is it not because of that that this passenger service was left as it was originally arranged in the hands of the Locomotive Department?—It was left so because there was no need to alter it. It was quite satisfactory on account of it being a regular business.

937. That being so, so far as booked trains or any booked trains are concerned, would not they be under the same category?—Yes, they would. There are so few of them, compared with the total number run.

938. Of course, Sir Sam Fay suggested this morning that it might be advisable if there were more?—I do not know that that was quite suggested, that more might be tabled, but only as conditionals.

939. All the unbooked trains and all the goods trains are dealt with by the Traffic Department?—That is so.

940. And I understand, shortly putting it, that the arrangement is for the Locomotive Department to let the Traffic Department know daily what engines they have available for work, and the Traffic Department then order what engines they require out at specified times, and after they are out they deal with them themselves entirely?—That is so.

941. And it is quite possible that at the end of the day they may have arrived at a running shed where they were not originally allocated?—Quite so.

942. Eventually they get back to their own shed, but during the time they are away they are dealt with by the shed which is stabling them at the time?—That is so.

943. What returns do you get that will enable you to satisfy yourself that the best possible working is got out of those engines?—That is difficult to answer. I get a return which shows me what each engine that I have in use is doing, but I would not have any record of what the engine was doing when I did not want it.

944. Have you got any statement which shows you the miles per hour that you get out of the engine?—That is got out by the statistician. I do not get that out. That is the statistical branch.

945. But are not statistics of any use to you?—Oh, yes.

946. Then, whoever gets them out, do they not come to you as valuable from the point of view of scrutiny?—I get certain information, yes.

947. Do you get that information?—Yes.

948. How soon do you get that information after the actual working?—I suppose it would be about three weeks.

949. I am informed that that information is not available. I have asked for it. There are no freight miles per engine hour?—Freight miles you are talking of now?

950. Yes?—I thought you said miles run per engine.

951. Or freight miles in the hour, whichever way you put it, it is the same thing. It is a means of measuring the work done?—Yes.

952. I want to get from you what you have that will readily enable you to compare the amount of work done by your engines at any particular time and any other particular time, whether it is satisfactory or whether it is not satisfactory?—Well, that, as a matter of fact, is not of any very great value to me as a transport officer.

953. Not whether you are getting good work out of your engine or bad work?—As to whether I am employing the engine rightly when I have it, yes, but then I do get that return every morning.

954. I want to know what that return is?—The return that I get every morning is a return from each of the depots showing the number of locomotives which have been employed during the previous twenty-four hours, the actual gross tonnage that they hauled and the actual gross tonnage that they were capable of hauling.

955. And the number of hours?—No, hours have got nothing to do with it.

956. But surely the work done per hour would?—No. What I want to ensure is that my people are properly loading that engine.

957. That is all the information you get?—That is my information. That is what I want.

958. And you are satisfied?—I am satisfied with that.

959. You say these figures are got out from the statistical department. You are not responsible for any of these statements?—Not for the compilation of any of those figures, no.

960. Because I get here the miles per hour out of the train?—Yes.

961. And yet I am informed that I cannot get the work done per hour. However, you cannot tell me anything about that?—I am afraid I cannot.

962. With regard to the carriage stock, I understood you to say that you had got sufficient carriage stock with the exception of suburban traffic?—To meet the ordinary requirements, yes.

963. Have you ever had any complaints from Mr. Lucy that he has not time to deal with the carriages properly in the works, because you were hurrying them out?—No. The only complaint I have had on occasion has been when I have had to withdraw the stock from the works at holiday time that he has not got them back quickly enough out of traffic.

964. I am not referring to holiday time?—This is holiday time I am speaking of now.

965. But outside holiday time you have no reason to suppose that Mr. Lucy has not sufficient time to deal with the carriages adequately in the works, and that he has not been pressed to get them out speedily?—He has been pressed to get them out speedily many times, directly the number goes up, and it is a varying number, of course.

966. And is that because you are tightly pressed?—At certain times of the year I am more tightly pressed than at others. Just at present, for instance, the call on the stock is not excessive. It is the winter time. There is not so much travelling and I am not pressed. I can, therefore, afford to let him have more in the shops than I could in the summer season.

967. One naturally understands that there are certain times of the year when you are more pressed than others?—Yes.

968. I am not referring to those times, which, of course, would be few?—It is not so much of a time as of a season. In cold months I could afford to let Mr. Lucy have more carriages in the shops than I could during the warm months.

969. At the present moment he is not pressed?—I am not pressed at the present moment. At the present moment he has quite a nice lot in the shops. I only saw the return a few minutes ago. He has 150 bogies in the shop. That is a high number.

970. At the present time you are quite content to let him have that number off?—Yes.

971. And you are not pressing him to get any out?—No.

972. Are you satisfied with the loads taken by the locomotives?—what I mean to say is that if you had stronger locomotives would you be able to take the bigger loads, or have you sufficiently powerful locomotives for the loads that you require to take?—If I had more powerful locomotives and if the drawgear would stand it, it would suit me to have a heavier load.

973. You could put heavier trains on?—Yes.

974. You have the traffic there to do it?—Yes.

975. Then it would be an advantage for you to have stronger engines?—If the drawgear would stand it.

976. Then I understood you to say this morning that the late running of these trains—I am looking at the moment at the passenger trains—was largely due to the locomotives—I will not say altogether failing, but not doing their work properly, so as to lose either five or ten minutes?—That is so.

977. I notice in this return that there are 1,523 cases due to the locomotive, but there are 1,155 cases due to traffic causes?—Yes.

978. So you see there is not such a very great deal in it; it is higher, but still there are 1,155 cases due to the traffic?—That is so.

979. And likewise here, in the suburban trains, I notice that there are 1,911 due to traffic causes and 1,333 due to locomotive?—Yes.

980. Which is really in favour of the locomotive?—On the suburban lines it is.

981. With regard to transshipping, I suppose Albury is one of your principal transshipping places?—Albury and Wallangarra.

982. Are you satisfied with the method of the mechanical means of transshipping?—No, I cannot say I am.

983. All your cranes are hand worked?—That is so.

984. And not very speedy appliances at that?—No, they are not. A large amount of the work is done by hand, too.

985. You have electrical power quite close?—Yes.

986. Would you not advocate some better means of mechanical transport?—As a matter of fact, a very comprehensive plan was got out some time ago for improving the transshipping arrangements at Albury. It was got out in conjunction with the Military Department, but so far the money has not been found to carry it out.

987. But you are not satisfied?—I am not satisfied. I know it is not up to date.

988. Sir SAM FAY: What do these traffic delays consist of?—Many of the delays, of course, take place on the single lines.

989. You mean crossings?—Yes.

990. Would there be no delays if they are keeping time?—I quite agree, but if you have a goods train, and that goods train has other work to perform, has shunting work to perform, and the staff take a little longer than laid down for them, it at once upsets a crossing, and once you upset a crossing it is very difficult to recover.

991. That would not apply to these suburban trains, would it?—No, not the suburban.

992. What are these particular traffic delays?—A large amount of the delays on the suburban line are caused by side-door carriages.

993. What do you mean by side door?—The ordinary compartment carriage.

994. But you can load and unload quicker?—It is a question of shutting doors.

995. By the staff?—Yes. You cannot see in those carriages when a person is going to get out and when they are not. With a car you can look right through the car. You cannot see through a side-door carriage. That is one of the principal causes.

996. What you mean is the guard is afraid to start the train because he is not sure whether the people have got out or in?—That is so, the guard at one end and the man in charge of the station at the other.

997. Are not your electrical cars that are being built now running on the North side?—Yes.

998. How many doors have they got?—They have two double doors and two single.

999. A double door in the middle and a single at each end?—No. It is a single door in the guard's compartment and then it has two double doors and a single one in the middle.

Witness—C. A. Hodgson, 16 July, 1924.

1000. You anticipate less trouble with that, do you?—Yes.

1001. It seems an extraordinary record for delays of that sort. Is there any other cause?—As a matter of fact, although the number sounds rather large there, the number of trains run is very great. It is only, after all, 6 per cent. of the trains. I think 94 per cent. were to time and 6 per cent. late.

1002. Yes, taking the suburban service as a whole, it is not a bad record, but with regard to your through trains, interstate trains, do you say that the main source of delay there is at crossings?—With the interstate train the main cause of trouble is locomotive trouble. That return is not on interstate trains. That is all our through trains.

1003. Take your through trains, are those delays crossing delays?—Very largely.

1004. What would be the other delays besides crossing delays?—Some of those delays would probably be caused by short platforms, the trains having to pull up twice. That is rather a prolific source of delay, especially when the traffic is congested.

1005. Going back to the evidence you gave this morning with regard to the interstate trains and the berthing arrangement, I would like to ask you one or two questions about that. Do you get a return of the number of berths occupied in each of those trains?—No.

1006. Is that ticket-issuing office under you?—Yes.

1007. Under your control?—Yes.

1008. Are there any berth tickets issued on the trains by the conductors?—No.

1009. None?—No. If a passenger wants to join a train, of course, he could not join an interstate train because they would not take him, but if a mail train, a man comes along to the conductor and the conductor has then to send him to the booking office to get a ticket.

1010. You mean that if I turned up on one of your interstate trains without a ticket, and there was a berth empty, I could not get it?—You could get it as long as you buy the ticket.

1011. I have my ordinary ticket, and I have not got my berth ticket. Who do I get my berth ticket from?—The conductor will advise you to get your berth ticket at the booking office.

1012. He would send me to the booking office?—Yes. There are cases, I admit, where the conductor says, "I will get your ticket for you," but he has not got the ticket to give you; he has to go to the booking office to get it.

1013. You have no record of the actual number of berths occupied on these interstate trains?—We have an actual record.

1014. I thought you said just now you had not?—No. You asked me if I had a return. We have the record in the diagram.

1015. What diagram do you mean?—The diagram of the car. Every car has a diagram which has to be entered up.

1016. Do you keep that every day at your office?—Yes.

1017. Showing the number of berths occupied on all these interstate trains?—Showing the berths that are occupied and the number of the rail ticket and berth ticket they hold.

1018. Does that apply to your mail trains, too?—Yes.

1019. Who checks that with the cash?—That would be done by the auditor.

1020. The traffic auditor?—Yes.

1021. Do those returns go to him?—Yes.

1022. Could you give us a return for last week of the number of berths available and the number of berths occupied in your interstate and your night trains to the country?—Yes.

1023. Showing exactly those that were occupied and those that were unoccupied?—Yes.

1024. Where do you concentrate the applications for berths that come from this office, and I suppose from the country as well?—Challis House.

1025. Where is that situated?—The city ticket office, Challis House, Martin-place. That is for the down journey out of Sydney.

1026. What happens in the other direction?—At the up station, it is at the station at which the diagram is held. That varies according to what the service may be. For instance, the up express from Brisbane is held in Brisbane. That is from Wallangarra. The up express from Albury is held at Melbourne. They send the diagram by the preceding train; the 4 o'clock train from Melbourne brings the diagram to Albury. Then Albury makes a note of any berths that may be vacant in case he gets any requests for them, and then each of the diagrams is handed to the conductor of the car.

1027. As far as the interstate trains are concerned, there is very little chance of anyone in New South Wales taking advantage of it coming from Melbourne or coming from Brisbane?—That is so.

1028. They have to take the following train?—Yes.

1029. I should like to ask you one or two questions about the rates. First of all, as to the classification; has that classification been altered of recent years?—To a certain extent, yes.

1030. But in the main, is it the same classification as has been in existence for a long time?—Much the same, yes. There have been various changes made.

1031. What is the general basis of the classification?—Originally it was supposed to be on the value of the article.

1032. What the traffic would bear?—Yes.

1033. That is the general basis, is it?—Yes.

1034. And your lowest rates are for manure?—Any manure, yes.

1035. And coal?—Yes.

1036. And your miscellaneous, then hay, straw and chaff, then your grain—they are about the same rates?—They are much the same rates, yes.

1037. And the general idea is what the traffic will bear?—That was the original idea.

1038. Not the cost to you of conveyance?—No.

1039. Did not whoever compiled this classification have some regard to the development of the country?—I presume it was so. Of course, I am speaking now of many years ago. That classification was got up long before I had anything to do with it.

1040. Have you had many complaints with regard to the classification?—No, not with regard to the classification.

1041. They complain of the rates, I suppose?—They complain of the rates. They all want them lowered.

1042. Have you got out in any shape the cost of conveyance of these various articles?—No.

1043. The actual cost of running a train, for instance, supposing it was composed of nothing but one article?—Yes, I have done that. I have done that in particular cases.

1044. Could you, without any difficulty, get out the actual haulage costs; of course, one knows that to do any business at all a railway has to provide its line, station, signalling, rolling-stock, and so on in order to do anything in the shape of business. If you get a few extra trains it does not make very much difference to your actual cost?—You only want the running cost then.

1045. Would you get out a statement showing what it costs of haulage—I mean actual cost for haulage of a train composed of nothing but wool, assuming that the train was up to its maximum weight—you would have to do it in conjunction with the Locomotive Department, I know?—Oh, yes.

1046. What I am getting at is the actual haulage cost, that is to say, wages, coal, oil, and any incidental expenses that may be connected with it. Could you get that out?—What about maintenance of lines?

1047. Nothing to do with it. You have to maintain your lines to do any business at all. I mean for this particular purpose. I want to realise what your rates are

giving. Could you do the same with regard to coal, assuming the train was filled up to its maximum capacity, and you would have to put in the haulage of the empties back again?—That is where the difficulty comes in, to know what empty haulage to put in.

1048. You put in the same number of trucks that you took away?—That would not cover it, because they do not always come back empty.

1049. That is all to the good, so far as you are concerned?—Yes. Am I to assume that they all go back empty, both for the wool and the coal?

1050. Yes. In coal, you know they do?—No, I do not. A lot of coal we haul in trucks and we bring the wool back in them.

1051. That is not in accordance with your statement. You distinctly stated that all your coal means a return of the trucks empty?—Oh, no. If you are dealing with the shipment of coal in hoppers, yes. If you are dealing with a shipment of coal in hoppers, the hopper has to go back empty.

1052. In asking you to do that I was not talking about sending coal to some station for local consumption; I was talking about your main traffic, which is about 7,000,000 tons a year for shipment?—There again we have the private owners' trucks.

1053. But you were telling us this morning you had not down here?—I might be able to get it down here. Of course, there again our locomotive coal and shipping coal is all brought by the same train on the South Coast.

1054. Taking the Newcastle area, whether the trucks belonged to you or not, you have to take them back again empty?—Yes.

1055. If you take the coal conveyed to Newcastle for shipment and the cost of the haulage of your empty train back again, that would give it, would it not?—That would give it.

1056. Could you do the same thing with regard to agricultural machinery, assuming again that you have a full train?—I take it what you want is the cost, and you want to know the revenue we get from the train.

1057. We can find that out afterwards. If you give me the actual cost in conjunction with Mr. Lucy of the pure haulage we could form some conclusion as to what your rates mean as compared with your cost?—I had better give you the cost per ton.

1058. You give it to me in my own way, please. I want the actual cost of wages, coal, oil, and so on?—Yes.

1059. The haulage cost solely?—Per train?

1060. Yes?—A complete train?

1061. From a given point to a given point?—Then you want to know what net tonnage that train will haul?

1062. I want you to assume that the train is up to its full capacity?—You want to know the net tonnage of the whole of the train?

1063. I do?—Of course, that will vary with the commodity.

1064. And could you do the same thing with live-stock?—Yes, I think so.

1065. There, I suppose again, you would have the empties back again?—Yes, almost every time. I shall have to take the total mile.

1066. You must take it, of course, where you have really got a traffic passing of some volume, your main business in connection with each of those particular lines?—Yes. I could get out, for example, the cost of running these trains from Harden to Goulburn. That is a locomotive run on the southern line.

1067. I wanted the thing right through to its ultimate destination; I do not want it in bits. If you are taking a shipment of coal?—A shipment of coal I shall have to take from the various collieries to Newcastle.

1068. You are bringing wool to Sydney?—Yes.

1069. Throughout the run to Sydney, wherever it comes from?—Yes.

1070. I want to see how far your rates really approximate to the cost you are put to as a haulage cost?—Yes.

1071. Then, as to coaching traffic, have you ever got out what the revenue is on these inter-state trains compared with your cost?—No, we have not.

1072. Could you get that out?—Yes, I could do that. Of course, the charge for the inter-state journey is regulated by the sea competition, and we are charging as much as we can get.

1073. I want to look at your cost in doing it, if you could get out the cost of working that service?—In connection with that there is a considerable cost at Albury in transshipping.

1074. Transshipping of passengers?—Yes, and mails. That is not actually a running cost.

1075. Give us the running cost. We will not complicate it. Let us have it as a clean proposition. We can estimate the other pretty well?—Yes.

1076. You are not taking anything free for Government departments, or for the shires, or the road authorities to any extent; you have given me a list, but it does not amount to much?—Very small.

1077. What you convey free in rates is negligible, is it not?—Yes.

1078. The carriage of mails is a subject of contract with the Federal Government, is it not?—It is a subject of an award really by the Inter-State Commission. It went to arbitration. The Inter-State Commission settled it.

1079. But does not the Federal Government control it?—The Federal Government, of course, controls the Post Office.

1080. Then your agreement is with the Federal Government?—The agreement is, yes, but the rate was fixed by the Inter-State Commission. The railways could not agree with the Postal Department, and it went to arbitration and the Inter-State Commission settled it.

1081. Anyway, the Federal Government pay for it?—Yes.

1082. And it is on a basis of actual carryings year by year—you take a test of the carrying?—Yes.

1083. Every year?—No, every four years, which is to be reduced to two. Up to now it has been every four years. That is where they have had the whip hand.

1084. Do you mean the traffic is growing and you are not getting any more money?—They pay on the start of the period.

1085. Anyway, when you get at the end of a period you get credit?—Not for anything we have carried in the past. It will only be for the next period.

1086. You cannot anticipate things very well?—No. We might even up between the two weighings, but they will not allow that.

1087. You say here in one memorandum you have given me with regard to the traffic you convey, that a large proportion of the traffic is conveyed at particularly low rates. You say that coal, coke, and shale represents 51.01 per cent. of the total tonnage, and ores, fruit, grain, hay, &c., 31.84 per cent?—Yes.

1088. You say that leaves a balance of 17.15 per cent. of the total tonnage hauled which returns a profitable revenue, and this latter item represents 2,313,259 tons out of a total tonnage of 13,000,000. You do not suggest that the whole of your revenue is got from 17 per cent. The way you have put it would merely mean that you are carrying all this other goods traffic at cost, and that you look to 17 per cent. of the total tonnage?—To pay our interest, practically.

1089. Surely that is not so, is it?—I think it is largely so.

1090. You see what it means, that 5 per cent. on the total money expended on the railways of New South Wales is paid for by 17 per cent. of the total?—Yes.

1091. Do you really mean that?—Of course, for example, our second-class goods are paying six times as much as our miscellaneous.

Witness—C. A. Hodgson, 16 July, 1924.

1092. What sort of basis have you got that out upon, because unless you have taken out the cost of running your trains?—We have not.

1093. How can you arrive at whether you are carrying that traffic at a loss or otherwise?—We are taking our total cost, not our hauling cost. Our total cost includes all overhead charges.

1094. Have you based it, first of all, on the whole of your tonnage and then taken your haulage costs, or how is it arrived at?—You can only arrive at that figure by taking proportionate amounts received.

1095. Are those statistical figures, or your own?—Those are largely statistical figures, I think.

1096. I do not know whether you are responsible for those or not. Of course, it is a very startling statement to make?—Yes. These figures were taken from the annual report.

1097. Do you believe that to be true?—I think it is largely true. I would not like to say that on that 82 per cent. we do not get anything towards our interest. There is no doubt we have to look to the high class traffic.

1098. The way it is put here by whoever put it is "This therefore leaves a balance of 17·15 per cent. of the total tonnage hauled which returns a profitable revenue," the suggestion being that the other does not return a profitable revenue?—Of course, as a matter of revenue, it pays the whole of the working costs and the whole of the overhead charges and the interest, and any traffic which only pays the working cost, plus the overhead charges, we should not look on as a profitable revenue, because there is no profit.

1099. If this is correct, it means that you convey all the minerals, the miscellaneous traffic, the fruit, the grain, hay, straw and chaff, and coal and coke at cost price?—Practically so.

1100. All the rest of it you look to as being available for paying interest on the capital?—That is our A B C, first and second, and those are our book rates, of course.

1101. What sort of an answer have you got to people who are classified in 1, 2, and 3?—It has been done absolutely on purpose. It has been done for a particular reason. It has been done in order to encourage people to go out in the country and produce. We have cut down our grain rates, we have cut down our hay, straw and chaff rates, our crude ores which they have to mine in the country—we have done it deliberately—and we expect the other traffics to pay for developing the country. It is a very good policy.

1102. The other traffics being live-stock, wool?—Well, wool is not a very high rate.

1103. I suppose your wool rate is based on what it will bear?—The wool rate has a long history.

1104. Is not that really the basis of it—what it will bear? Not exactly.

1105. It does not cost you much to convey it?—No. The wool rates were really made at a time of very keen competition between the various States. They used to canvas in each other's State to try and get the wool traffic, and that went on for many years.

1106. That would rather tend to make the rates low, would it not?—It did.

1107. Do you consider your wool rates to-day are low?—I think they are quite reasonably low compared with the value of wool.

1108. You are coming round again to the value of the article—what it will bear. That is really the basis of it?—That is so, undoubtedly.

1109. I am not saying you are wrong in this; we want to get the facts, that is all. We can draw our own conclusions when we get the facts from you. The rates you are charging for fruit, you are charging for so much per case in a great many instances without reference to distance?—That is so.

1110. There, I suppose, you would say you were conveying it for absolute cost or even less?—Yes. I do not think we make much out of it, but that is a deliberate policy to try and get the grower and the consumer into direct contact and cut the middle man out.

1111. Have you not got some differential rates for fencing wire and other things?—We have rates for articles made in the Commonwealth as against those which are imported, and we also have concessions which we grant on export business.

1112. But under the Act appointing the Commissioners, are you not debarred from charging a difference in rate for the same article between the same places?—No, I do not think so. I do not think it would apply in that case. As long as everybody can get the same rate, we cannot individualise.

1113. You are charging a different rate to a man who buys fencing wire in Sydney?—Yes.

1114. To a station in the country, if it happened to be manufactured outside this State?—That is so.

1115. Although it may come from the same warehouse in Sydney?—That is so.

1116. Precisely the same article?—That is so.

1117. Conveyed under the same conditions?—Yes.

1118. To the same place?—Yes.

1119. What is the underlying principle in that?—To encourage the local manufacturer.

1120. Is not that rate taking the place of a tariff, or an addition to the tariff?—Is there a tax on the imported article?—Yes.

1121. Then you take the place of the State in putting on a further tax?—Of course, the customs tax is a Federal tax.

1122. The Federal Government tax the article coming in?—Through the customs.

1123. And you charge more for conveyance on the railway?—Yes.

1124. That is a State tax?—That is really a State tax. It is to our interest, of course, to encourage the local industry.

1125. I am not arguing; I only want to arrive at the facts?—That is so.

1126. Do you get many complaints about that?—No. We had some pretty strong complaints when we said we were going to knock it off. I believe there have been one or two complaints with regard to the higher rate that has been charged on the imported article, but I know when it was suggested knocking it off there were some very strong complaints made.

1127. You mean the manufacturer here complained?—Yes.

1128. It really amounts to this; that the Commissioners have put themselves in the position of the customs, have they not?—Practically so, yes.

1129. Although the Federal Government have taxed it previously?—Yes.

1130. This is the thing as it stands at page 19: "Subject to the provisions of this Act, all such tolls shall at all times be charged equally to all persons and at the same rate whether per ton, per mile or otherwise . . . in favour of or against any particular company or person travelling or using the railways." Do you not think that you are debarred from making a differential rate?—We have decided that we are not, with regard to that particular scheme any more than we are when we make an allowance on quantities.

1131. But then you would make an allowance to everybody?—Undoubtedly. So we would here to everybody who produced the local article.

1132. You are differentiating between one man and another, because he has a thing which was not produced at the same place. That is what it means, is it not?—We will give that concession to any man manufacturing in Australia.

1133. It says here you must not give a reduction in favour of or against any particular person. Now you are giving a favour to a local manufacturer here as against a person here who is selling an imported article, are you not?—That all depends on who is paying the freight, of course.

1134. But you could not differentiate between the consignees and the consignor?—Anybody in that case could get that rate if he liked to buy the local article.

1135. How do you know whether it is an imported article or manufactured?—They have to declare it.

1136. Is this the only case where you do this?—No, there are others. I think you will find that wine is one of them. Locally-made wine is charged at a cheaper rate than imported, though there is no actual difference in the method of dealing with it.

1137. Same sort of consignments and same conditions and it does not cost you any more?—No, it is done purposely to encourage local industry, and as far as I know we have never had it questioned. We have had complaints, but apparently nobody is game to take it up.

1138. You are making a distinct difference between the conveyance of an imported article and one manufactured here?—Yes.

1139. When I asked you to get out the cost of the trains I am not sure whether I gave you grain?—I will put in grain.

1140. Have you had any complaints with regard to the live-stock rates?—Yes. The charge is so much per truck, and there are two sizes of sheep vans, the smaller of which is being done away with. I think now there are about 300 small trucks.

1141. When trucks are ordered are they ordered for a number of sheep?—No, just the number of trucks.

1142. You do not specify the number to be conveyed, but leave it to them to put in as many as they like at their risk?—That is so.

1143. Do you undertake to water and feed animals en route?—No. Generally speaking, it is not done unless the journeys are very long, and in that case we advise the people that the stock will have to be spelled, and they make arrangements with some local man to look after them.

1144. Do you pull the train up to water the stock?—Yes. When they have to be spelled during long journeys they are unloaded at some suitable place. There is no law here which compels the cattle to be fed en route.

1145. Is there not a good deal of suffering on the part of the animals?—I do not think so. We used to get a lot of complaints, and that is one of the reasons that we have made the alteration, and I think the trouble has now been cured, judging by the letters we receive. I do not think the animals suffer now. The worst time for them in regard to water is the hot weather.

1146. Of course there have been some pretty strong representations made in England and elsewhere of your methods out here, but you think you have cured it?—I do.

1147. As far as checking is concerned, goods accounting and that sort of thing is dealt with by the traffic auditor?—Yes.

1148. And your warehousing is not of a very extensive character?—That is so.

1149. Are you responsible for the figures which have been got out as to the losses on recently-constructed lines?—No.

1150. Do you find very much road competition?—We have had a certain amount, but not as much now as previously. I think that is largely owing to the bad roads. We might feel it more with better roads. I know motors were being run to Bathurst, but owing to the state of the roads it did not pay them to go. One thing that helped the motors was the freight rates for petrol to the country. We found they were taking it and bringing back produce. When we very considerably dropped our rates that stopped it.

1151. The most effective way is to give a good service yourself so that people will not be induced to put on motor-cars?—There is always the advantage of delivery at your door, and we have no delivery in country towns.

1152. In the compilation of these rates have you paid

any regard to the heavy gradients?—No. We simply make the mileage rates applicable to the whole of the railways without regard to gradients or destination.

1153. With regard to passenger rates, you are charging outside a radius of 35 miles from Sydney and 35 miles from Newcastle rates which are double per mile?—They are not double the suburban rates. The second single for 10 miles suburban is 10<sup>1</sup>/<sub>2</sub>d., and the other is 1s. 6d.

1154. Is the justification for that that it has always been so?—To a large extent, yes. As a matter of fact these very small mileages hardly affect the travel at all, because there are hardly any tickets issued. The difference is not so great with greater distances; 50 miles is 8s. 10<sup>1</sup>/<sub>2</sub>d., as against 7s. 4d.

1155. Do you see any justification for charging a passenger who travels 50 miles in the country double what he would pay for travelling 50 miles within 35 miles of Sydney?—Of course, it is a very much more expensive proposition to us, because it costs so much more to convey him. On account of the loading we can run our suburban trains at a very cheap rate, but in the country we do not get the loading. We can actually run cheaper per passenger in the town than in the country.

1156. Take the case of a passenger who has to travel in a mixed train. Do you suggest that it costs more to convey him in the country than in the suburbs?—We might take six passengers in the mixed train and 600 in the suburban, though I admit there is a certain amount of goods traffic. The passenger does not get greater comfort on a mixed train.

1157. Have you any idea what it would mean if you made the country rate the same as the town for passengers?—It would mean a terrific reduction, absolutely more than we could face.

1158. You are not charging the same rates per mile from here to Melbourne as you are to Albury or Wagga?—That is so.

1159. If a man travels from here to Wagga he is paying practically the same fare as if he went to Melbourne?—Oh, no. If he went to Albury he would not pay quite the Melbourne fare.

1160. You said you would lose money by compiling through fares on the basis of your suburban scale. Would that be so, having regard to the reduced rates that you are now charging to Melbourne and Brisbane?—Of course, we would not lose that on the interstate passenger, but we would on the passenger travelling within the State. I am not sure, but it might affect us in regard to whether our mileage proportion would work out at more than our local rate. The basis of the interstate fares is largely steamer fares.

1161. Are they charging less per mile in Victoria as between Albury and Melbourne than you are?—I am not sure, but, of course, the Victorian railways altered their rates considerably with ours.

1161A. Anyway you think that you could not face the reduction of these country passenger fares, and put them on the same basis as your suburban fares?—It would be a very serious reduction, because it would not be confined to passengers travelling between two points in the country. At the present time if a passenger travels to a station 60 miles from Sydney, and pays for the first 34 miles at the suburban rate, and the balance of the distance at the country rate, he could go right through at the suburban rate. Every passenger travelling to or from Sydney outside the point of the 34 mile limit would get a reduction which would increase with the distance.

1162. When did you first raise your fares?—In August, 1917: 10 per cent. on suburban scale, country scale and periodical tickets. It was raised a further 7<sup>1</sup>/<sub>2</sub> per cent. on 1st November, 1918, and on 1st January, 1920, it was again increased. The difference between the pre-war rates and those charged now are shown on the paper on the document in the possession of the Commission. As to the suburban fares in 1913 there was no regular

*Witnesses*—C. A. Hodgson, 16 July, and R. L. Ranken, 18 July, 1924.

1163. You have gone up from .5d. per mile to 2d. for the first mile, a penny afterwards, and after that three-farthings?—Yes.

1164. And in regard to your country railway stations from 1 to 100 miles you are charging 1½d.?—Yes, as compared with 1d. under the pre-war rates.

1165. So at the present time you are charging, if anything, a little more than you were before as between the suburbs and the country?—I do not think there is very much in that.

1166. Is there any difference in your charges for goods traffic in the suburban area?—No, we are charging the same all round. The only difference between the suburbs and the country is the passenger fares; that has always been so, though it leads to all sorts of anomalies.

1167. But the loss is greater than you can stand?—Yes.

1168. Did you not raise those passenger rates in the country before you increased the rates in the suburbs in 1917 or 1918?—No, it was 10 per cent. all round at the same time. That is the first increase after the war started. Early in 1914 we did raise the country 5 per cent., but not the suburban.

1169. What was the idea of that?—Trying to get a little more money. It is true that we had more passengers in the suburbs than in the country, but a 5 per cent. increase was so small as hardly to be felt in the country.

1170. What sort of facilities do you give country people for excursions?—We give them excursions at Easter and Christmas, and on three other occasions during the year to Sydney, while they can go to other places if they like. The excursions follow the ordinary fare in so far as that some tickets are issued at single fare and some at single fare and a quarter for the double journey.

1171. Do they bear any relation to the excursion rates you charge from here to the country?—To a certain extent. The week-end excursion fares charged here at the single fares for the return journey. We do not charge week-end fares in the country. We did start it, but it did not work. When they did their shopping here they took their goods back as passenger's luggage.

1172. You said you were not satisfied with the arrangements for transshipping. Is there any considerable delay with respect to that?—Practically none with anything that really matters.

1173. Do you not sometimes get a lot of stuff to transship at Albury?—Yes, sometimes a heavy lot of fodder, but there are agents here who do the transshipping. They provide the labour.

1174. Do you mean to say that traffic consigned from Victoria to New South Wales or Queensland is taken charge of by agents for the purpose of transshipping?—Yes. The stuff is largely consigned to the agent for forward.

1175. Is there anything gained by that from a public point of view?—It is preferred.

1176. They must make something out of it?—They do, not in rate, but I think they are able to watch the market better.

1177. Here is traffic coming through an imaginary line at Albury, and you have agents there to accept traffic coming from Victoria here or going from here to Victoria?—Yes. I think you will find that when the traffic leaves its destination nobody knows where it is going.

1178. Surely that would only apply to a certain proportion of the traffic?—That is so, but it is a fair proportion. I am speaking principally of fodder. They unload the trucks at Albury, and reload without cost to us. It is a local rate to Albury, and then it is reconsigned.

1179. Does not that cost more?—Probably not, because the interstate rate would not apply except to Sydney, and this stuff is not going to Sydney. In the case of stations inland they pay the sum of local rates.

1180. Is there the same difference between your goods rates interstate as there is between your passenger rates?—No.

1181. You are charging purely local rates?—Not to Melbourne. We have special rates that we quote to Melbourne. That is owing to the sea competition.

(Witness retired.)

(The Commission adjourned.)

#### EIGHTH DAY.

FRIDAY, 18 JULY, 1924.

(Held at Chief Secretary's Building, Macquarie-street, Sydney.)

COMMISSIONERS:

Sir SAM FAY.

Sir VINCENT L. RAVEN.

ROBERT LIMOND RANKEN, Engineer-in-Chief for Existing Lines, New South Wales Government Railways, sworn, and examined:—

1182. Sir SAM FAY: Your jurisdiction extends to all existing lines?—Yes.

1183. And includes any duplication and extension of same?—Yes. All extensions to existing lines. Anything in the shape of a new line as such comes under Construction Branch—under Mr. Hutchinson. I have nothing whatever to do with that. I might say that plans of station-yards and bridges, or anything like that, are submitted to me before they are constructed.

1184. Is there anything in the shape of transfer from your department to the Construction Branch in respect of rails or materials and so on?—Yes. The supply of rails. I arrange the contract for rails for both my branch and the Construction Branch. The Commissioners, of course, arrange the contracts with the Broken Hill Steel Works or Hoskins Limited for both the Construction Branch and the Existing Lines Branch.

1185. How about material for bridges, and so on?—We manufacture bridges for the Construction Branch, and we would continue to do so if our shops could do it, but recently we have had to let contracts for them—for several bridges, but that is only because the amount of work is more than our shops can hold.

1186. Then the work of the other Chief Engineer for new works is confined to earthworks and construction, but not to the purchase of material?—That is so, as far as rails and sleepers are concerned. Of course, he carries out the designs for bridges and we work to those designs.

1187. Have you any voice in the design of the new lines?—Yes, simply as far as station arrangements are concerned.

1188. Have you any voice in the bridges?—The bridges are designed to the loading we adopt.

1189. Are you consulted?—No.

1190. You consult the Commissioners, of course?—Yes. There is a transfer of costs in connection with all the materials handed over to the Construction Department.

1191. Who checks that—anything that you transfer that is in your books?—Take the rails, for instance. My inspector passes them. That is, new rails. We do hand over a certain amount of material taken out of existing lines—second-hand rails. We are doing that. We have done that.

1192. That is, I suppose, main road rails and put into pioneer lines?—Yes.

1193. The figures in connection with that go through your own accountant?—Yes, my accountant puts the transfer value of the rails on that.

1194. Is there any checking of your accounts at all—anyone outside your accountant?—The account goes through the Chief Accountant, of course, but no other.

1195. He does not check them, does he?—No. We have an architectural staff of five men. They are all-round men who can do architectural work. It comes under the Principal Designing Engineer. We do not call them architects, but they are architects. They do architectural work in connection with station buildings, and all that sort of thing, or alterations and additions.

1196. You are responsible for the coal-mine?—Yes. I am responsible for the mechanical side of it. The Superintending Engineer, during the developmental work, is responsible to me for the proper installation of the necessary machinery. He is an experienced coal-man. He is not the man below ground. The mine manager would be below ground.

1197. Does he look after his own machinery or does your man?—My man looks after the machinery below ground, and eventually when we get all our electrical gear in operation he will be the man responsible for the upkeep of the machinery—the electrician. The accounts of the coal-mine come under my accountant.

1198. You give the lengths that your gangers are responsible for—it is fairly long, is it not?—Yes. In places it is on the pioneer lines. Are you referring to the three men attending to the 10½-mile length?

1199. Yes?—They do their job. It may appear long, but if a man is attentive and methodical he can get through the work all right with the light rail; that is, with the 60-lb. rail. It is not a very heavy section.

1200. You have to go a pretty long way for ballast for your Sydney area?—Bombo quarry. All the volcanic dykes have been exploited nearer Sydney. We find Bombo is a very economical place with the vertical strata.

1201. Are you re-ballasting the Sydney area?—Yes.

1202. I notice you are pretty short in some places?—I suppose you saw the sections that have been opened up for cleaning out the ballast for the electrification.

1203. Take between here and Parramatta, there seemed to be some sections there which looked to me to be fairly thin in ballast?—We did not complete our last year's ballasting programme, because I am taking so much ballast for the electrification, but the men soon let me know if there is anything at all doubtful about the road. Of course, we are clear of the sleepers. We have to keep our sleepers clear of ballast.

1204. I notice your sleepers are very short compared with the general rule throughout the world?—Well, we reduced them from 9 feet to 8 feet. We used to have a 9 feet by 10 x 5, but it is considered economical to reduce it to 8 feet. We found no difficulty about it. We knocked off a foot straight away. We found that the deflection of the sleeper was simply working the ballast out. The last 6 inches of the sleeper became useless so far as supporting the rail is concerned.

1205. You have got your sleepers fairly close together?—18 to 40 feet rail, 2 feet 6 inches.

1206. And you stagger your joints?—Yes. That means a joint every 20 feet.

1207. The line would appear to be rather noisy. Do you think that is accounted for by having a joint every 20 feet?—I do not think so. Do you mean the corrugated rails?

1208. No, I am referring to the ordinary running?—No, it has not struck me that way. I do not think that would affect it.

1209. It is 20 feet instead of 40 feet?—I think it is always more noticeable. My experience is that if you are on the square-jointed road you hear the knock-knock far more clearly—if our joints are noisy my fitters ought to be doing more work I think.

1210. Have you got a yearly programme of renewals—absolute renewals?—Yes.

1211. I do not mean a programme limited to one year, I mean over a series of years?—No, just the year. I submit every year the requirements for the following year, based on personal examination by the responsible officers, if possible—that is, my divisional engineers, and next to them their chief inspectors.

1212. You give a very long life to your rails. I suppose that is the result of your experience here?—Yes. Are you referring to eighteen years?

1213. It is the other figures that rather staggered me—the forty years?—That is so, that is the life of those rails. Of course, these figures were taken out from actual renewals. They are really the past life of rails. I think you would rather have had my estimate of the future life of the rails.

1214. Your experience of the past will be about the same that is, the 71½ lb. rail for instance; was that on the main line here?—Yes. There is a lot of 71½ lb. rails to the north of Armidale—between Armidale and Walangarra on the north-west, and between Boggabri and Narrabri. Of course, the traffic is not very heavy there, but those rails have been there forty years, and I am sure some of them will be there another forty years. We have had them analysed, and there is only 1½ per cent. of manganese. They are splendid rails; but there is nothing to show that in places where the traffic is light they will not last—well, I do not know how long—so long as we keep the timber in and keep the joints up. They do not get much rust up there, nor on the New England tableland, and out west none at all practically.

1215. Are the ones you are getting now as good as the old ones?—Yes. The funny part about the 71½ lb. is that they are the same weight as when they went in. We have had some come out heavier than when put in, but that, of course, must be a clerical mistake. There was a rail the other day with forty years' life, and it only lost ½ lb. The item in the estimate of expenditure for last year—"provision for writing down capital account"—is this; take a concrete instance. There is a carriage shed now in the Sydney yard which has to be taken down, demolished, and rebuilt in connection with the city railway. The original cost of the existing carriage shed will be debited against working expenses. That is what we call writing down the capital account.

1216. You have given the actual maximum loads here; are they the weight of rail or on the bridges, you have got a lot of 14 tons I see?—Yes.

1217. Is that by reason of the rail track or the bridges?—The track.

1218. You have nothing on your main line between here and Albury which is down to that?—No, they will carry all N.N. class engines.

1219. And your lines to Newcastle and Grafton?—Yes.

1220. When you get beyond Grafton you have a pretty low weight of rail?—Sixty lb. If the line is made through Kyogle as the main line to Brisbane we will have to re-lay. That has been provided for in the estimates.

1221. Speaking of the main line generally, you are up to about 20 tons per axle?—Yes, and as far as Orange on the west. Of course, those engines do not run on the west.

1222. You give the maintenance cost per track per mile?—Yes.

1223. It varies from £504 to £1,412. What is the particular feature of the Hornsby to Milson's Point line—

Witnesses—R. L. Ratken, 18 July, and F. C. Garside, 21 July, 1924

£1,400 per mile?—We have had heavy repairs recently on the Milson's Point line. It is short—1 in 50 grades—and fairly sharp curves and pretty constant traffic. That is a line that is going to be electrified.

1223A. Will you have greater maintenance costs after electrification?—I think our maintenance costs will be heavier.

1224. It would naturally be so if you get a more frequent train service?—Yes.

1225. Is that the only reason?—I think the electric rolling stock tends to disintegrate a road more than steam.

1226. Do you mean the low centre of gravity?—Yes.

1227. I assume these figures are based on your actual experience?—Yes, they are actual instances.

1228. When you come to the pioneer lines you get down to just over £100 a mile?—Yes. I have particulars if you will allow me to revert to the Milson's Point line: relaying £318, fettlers £512, bridges £80, station buildings, £338, and supervision £106, making £1,354. Those are the main charges for last year.

1229. They will not recur?—No.

1230. So that those figures do not really mean your average cost?—That is not the average. This was based on last year—based on 1923.

1231. Sir VINCENT RAVEN: I understood you to say that as far as new constructional work is concerned it is not under you?—That is so.

1232. To what extent were you consulted before a new line was constructed I was not clear; are you consulted at all with regard to gradients and curves and that sort of thing?—No, but of course the Commissioners are consulted.

1233. The question of gradings and curves would not really be a proper one to put to you; of course, your lines are full of them?—Yes.

1234. In going over them there are many places in which it would appear that some of the gradients and curves might not have been as bad as they are?—Some of them are very bad—Tarana to Oberon. Of course, we had to convert a special engine to run on those. They are laid with cheek rails all through. I am not consulted about lines like that. The Public Works Committee reports to the Government, and if the Government says a line has to be built, of course it is built. The Commissioners have a say, and they report as to what they consider to be the financial aspect of the line. My position is that when the line is finished I have to take it over and run it. I naturally do not look forward to taking over lines like that.

1235. Of course, the effect of gradients and curves are an ever-lasting uneconomical cost?—Absolutely.

1236. And such questions require very careful consideration as to whether you should not spend a little more to begin with than have to bear permanent costs afterwards?—Yes. I have nothing to do with that.

1237. With regard to the weight load per axle, do I understand you to say that it was the rail that governed that, or the bridges, or both?—Well, it would be both.

When I said "rail," I really meant on the pioneer lines, that are unballasted—what we call earth ballasted lines, and it is not really rail. I was wrong in saying that; it is the general construction of the line.

1238. So far as your main lines are concerned, the ballast would not apply?—No.

1239. Only the pioneer?—Yes.

1240. So far as your main lines are concerned you have not restricted the weight of engine design?—Not generally.

1241. And you go up to 20 tons an axle?—20 tons 7 cwt.

1242. Have they ever asked for anything more than that?—Yes, we are making provision for more than that. We are making provision for the Cooper E.50.

1243. With regard to the electric motors running over your lines and the wear on the railway, would not the extra wear be largely due to the acceleration and deceleration and constant application of the brakes?—Yes.

1244. Apart from the low centre of gravity?—I could not say which is going to hurt the most. I do say that a low centre of gravity injures the road.

1245. If it is an electric locomotive you do not say it would do any more harm—in fact, less harm than a steam locomotive?—Yes.

1246. It would do less harm?—The injury would be done by the acceleration and deceleration and the application of the brakes, but I do not think if the electric locomotive is designed with a reasonably high centre of gravity we would have that peculiar wearing of the rails which is taking place in Victoria now.

1247. You would not agree that it would have a less wearing; you have got a rotary motion instead of a reciprocatory motion.

1248. Which is a hammering motion all the time on the rails?—Yes.

1249. It is largely due to the multiplication of the working unit on the train—in the multiple unit?—Yes.

1250. Really half your motor coaches have a moveable mechanism?—Yes.

1251. With regard to those rails—forty years old—the 7½ lb. rails, I presume that as they get older you move them on to other sections of the lines where there is less traffic?—Yes, that is the intention. We are doing that now. We have laid some sections, and instead of putting in the light 60-lb. rails we have put in 80 lb. recovered rails.

1252. What staff have you got in connection with the mechanical side of the coal-mine?—There is the superior tending engineer, the underground manager, and, I think, about 500 men. The total number of men employed on all operation is 556, of which number 119 are miners engaged on coal production. That is practically the whole of the staff.

1253. Do you consult with the Chief Mechanical Engineer at all about mechanical matters connected with it?—Yes. I get the benefit of his advice whenever I want it. He is very good to me—Mr. Lucy—in that respect.

(Witness retired.)

#### NINTH DAY.

MONDAY, 21 JULY, 1924.

(Held at Chief Secretary's Building, Macquarie-street, Sydney.)

COMMISSIONERS:

Sir SAM FAY.

Sir VINCENT L. RAVEN.

FREDERICK CHARLES GARSIDE (Comptroller of Stores, New South Wales Government Railways), sworn, and examined:—

1254-55. Sir SAM FAY: I wish to ask you a few questions about your system of purchasing stores. Do you prepare the tender forms?—Yes, for the majority of our purchases; in one or two instances where large plant is required, e.g., for the power houses—turbo-alternators—

the Chief Electrical Engineer would prepare them—whenever they are highly technical.

1256. Would you prepare the tenders for machinery?—Just in a few cases of small machinery; usually the engineering branches would prepare those.

1257. Do they then send them to you?—In the majority of cases, yes, but in the case of a big power-house plant, the Chief Electrical Engineer handles the business him-

self up to the point of getting the Chief Commissioner's approval. The papers are then handed to me so that we can devise all details as to payment, delivery, and so on.

1258. Then, to whom are the tenders sent?—Usually sealed tenders are directed to the Secretary for Railways. Some tenders—the unimportant ones—come to my office.

1259. What would you call the unimportant stores?—Lines that we would require every day.

1260. You do not refer to annual contracts?—No, the tenders for those all come to the secretary, and I attend on the day that they are opened.

1261. Are they submitted to the Commissioners straight away?—No, they are sent to me for analysis and recommendation, and I make the recommendation to the Commissioners, and they accept the tender.

1262. Through their secretary?—They send out the letters of acceptance finally—we advise the letter of acceptance, and the Secretary sends out that letter.

1263. Are your annual contracts advertised in the newspapers?—Yes, always.

1264. You in some cases select particular firms, do you?—Very rarely; we have competition for most of them.

1265. For tenders other than annual—do you advertise those?—A number of them we do—where specific quantities are required.

1266. In other cases you select the firms and ask them to tender, do you?—Very rarely.

1267. Those are the tenders that come to you direct, are they;—not annual tenders, but the other tenders that come in from time to time?—Yes, quite a number of them come to me direct.

1268. And you take the instructions of the Commissioners upon them?—Yes, I do not make the purchase until I get the Commissioners' authority. They see the actual detail of it.

1269. Sales of old material—do you advertise in that case?—Yes. We separate our advertisement under the columns likely to catch the eye of intending purchasers, i.e., under the "Sale" or "Machinery" column, as well as under our own particular advertisement each week.

1270. Do you confine your advertisements to Australia for old material?—Yes.

1271. Who is responsible for the analysis of stores?—In a measure, I am.

1272. In a tender for a particular department, that department would specify what it wanted?—Yes.

1273. But, when the stores are supplied, who analyses them?—First of all you have to count the articles if more than one; then there is the question of seeing that you get the particular thing that you expected to purchase?—Yes.

1274. Who conducts the analysis?—We do most of the receiving with our own officers; but where it is material of a technical nature we get an inspection certificate from the branch concerned, and bring probably their research engineer into the matter to make the inspection and give us a certificate that everything is true to specification before we accept it or attempt to issue it.

1275. I gather from your memorandum here that you had some chemist in your department; but that is not so, is it?—No, the chemist is now attached to the Chief Mechanical Engineer.

1276. You have very little control outside of your own particular stores in Sydney—no direct control of stores, have you?—We have not the direct control; but we have a fair measure of control from the fact that we get a monthly statement of the stock held in the trust stores, and I am also able to keep quite a close watch on those stores through my own inspectors and the stock-taking inspectors—we have five of the latter.

1277. Can they in 12 months thoroughly analyse the whole of the stores throughout the railways?—We have only had experience of them for the past 12 months, and we have found it quite a big task to cover the position in 12 months.

1278. When they are examining the stores, do they examine the stock of scrap on hand, or make any report upon it?—Yes.

1279. Do they question the out-stations as to obsolescent stores?—We get a close report on that, and they are authorised to arrange with the local officers to send in any material that is slow moving or obsolescent, and deal with it on the spot while they are there.

1280. You do not take stock at the end of each year?—Not under this system—it is a continuous stock-taking.

1281. Then your certificate that you give to the Auditor-General is a certificate from the books, subject to the continuous stock-taking which your inspectors carry out?—Yes.

1282. Have you got what you call a manufacturing account?—Yes, for each department manufacturing material.

1283. And they manufacture, for instance, in the foundry at Eveleigh for all departments?—Yes.

1284. How do you charge out the cost to other departments?—The Chief Accountant sets up a division of the stores advance account which he calls a manufacturing account. That operates between the Chief Accountant and the head of each manufacturing branch. The Chief Accountant at the end of the month debits the particular branch with the cost of materials and the wages in production of the various articles, and we take those over through the stores advance account at the end of the month and give credit to the particular manufacturing branch. The bulk of that work is done through the Chief Accountant.

1285. Do you know how he arrives at the charge that he makes to another department, for foundry materials, for instance?—The general principle is that the wholesale foundry cost is debited to store advance account, and from this an average cost per lb. or cwt. is arrived at for retail charging to the branches supplied. It is arrived at mostly by averages; e.g., brass-castings in the rough to-day could be priced at 7d. per lb; finished brass-castings, 2s. per lb., and so on. We would take the average of the foundry output for the month.

1286. And he gets the necessary information from the locomotive department to enable him to adjust?—Yes.

1287. He gets the actual charges for raw material and labour?—Yes.

1288. I see, you sell quite a lot of scrap material. According to this return, in the year ending June last, you sold £145,000 worth?—That is so.

1289. That is much more than you ever sold before?—Yes it is a record. Prices were good, and the demand for our scrap better than ever before, because of the operations of Hoskins, Broken Hill Proprietary Company Ltd., and the steel works generally.

1290. Still you would have sold before?—Yes.

1291. Does it mean that you got better prices?—Yes, and competition was very keen.

1292. When you buy through the Agent-General in London, do you give him particulars of what you want?—Yes.

1293. I see here, that you suggest to him the firm or firms to be approached?—Yes.

1294. You do not leave it to him?—We do not altogether take away his initiative, but Mr. Lucy suggests a list of firms, which he would be prepared to draw boiler-plates from, for instance, and it is generally a fairly extensive list. If I might explain: we had some difficulty, a few years ago with Stewart and Lloyd in regard to some steel plates which turned out badly, and the Chief Mechanical Engineer and the Chief Commissioner were very concerned about the matter, and, I think, following upon that certain firms of repute were mentioned in all the succeeding tenders.

1295. Have you not a consulting engineer in London?—Yes; Mr. Davis, who is attached to the Agent-General.

1296. Did he pass the material of which you complained?—I could not say at the moment.

Witness—F. C. Garside, 21 July, 1924.

1297. That would be the check in the ordinary course?—Yes.

1298. Have you any check upon manufactures in the shops for the particular department manufacturing?—Yes. I issue the majority of the manufacturing orders, but I do not issue them until satisfied that they are really wanted, by checking up the stock on hand and following the issues. I very often refuse a manufacturing order.

1299. Do you mean to say that you have any control over the foundry at Eveleigh?—I do not say that I have direct control; but they ask me to issue the manufacturing orders. If I am satisfied that they do not really want them, I tell the Chief Mechanical Engineer the position as to stocks and rate of issue and that in my opinion the manufacturing order is not required, or that it should be cut down.

1300. Do you deal with the output of coal from the State colliery?—Yes, I arrange for its disposal.

1301. And you debit the locomotive department or any other department with the cost?—Yes.

1302. Based on the general cost of running the colliery?—No, we take the average price of coal, spread over the whole of our supplies.

1303. You are getting coal at varying prices—from the north, south and west?—Yes.

1304. And you are charging out at an average price?—Yes, for all our private supplies.

1305. Including your own colliery?—I am not absolutely sure on that point; I do not think we take the railway coal-mine into the average price—the price of coal there runs about 10s. 6d. per ton, whereas the other is an average of 15s. 3d.

1306. If you do not take the average price, then you must allocate it to a particular service—i.e. your own coal?—Yes.

1307. Do you keep any record of the consumption per engine?—No that is done by the locomotive accountant. I do not keep the records, although I am in touch with the whole of the business through the locomotive and stores committee each month.

1308. Do you keep a record of oil supplied to the engine-men?—Not a detailed record—that is kept by the locomotive accountant.

1309. You say here: "Oils for engine-men are supplied from locomotive trust stores up to the quantity authorised for the journey to be taken." You have nothing to do with that?—That is handled through the trust stores. I do not keep any records of the oil used for a particular journey.

1310. You mention here: "The quantity of coal required to fill the tender is calculated from the skips into which it is loaded." Again, you do not keep a record of that?—Not a detailed record. I may say that when you called for that information I wanted to get you to realise, if you could, that we endeavour to take an active interest in the whole of the supplies whether they go through the trust stores or not.

1311. Then, this is simply a record of what is done, though it is not all done under your control?—No, not directly under my control.

1312. Stores for the construction branch. Are they charged out direct to the job in all cases?—The greater proportion of the material is. There is just a small portion of the stores held against the stores advance account regularly.

1313. What sort of examination do you make of the coal stores. You keep a quantity on hand which is estimated to last two or three months, I think?—We reckon on keeping two months stock to meet industrial trouble. I check that with the stock taking inspectors as well.

1313A. They take an actual taking—estimate the value of the heaps, do they?—Yes.

1314. Are you responsible for those figures of the cost of material as between 1913 and 1923?—Yes, they were prepared from the Eveleigh stores ledger.

1315. You say that in 1917 and 1918, the Government accepted a debit for a reserve of 300,000 tons of coal through the Public Works Department. Is that stock still in existence?—Not to that extent—only about 60,000 tons is in existence at the present time, and is held for the public works at Port Waratah. That 60,000 tons is not included in my value of the coal on hand; it is altogether outside of us; we clear it as soon as we can.

1316. But was it intended to keep that as a reserve?—Not as a reserve for the Commissioners. We hold our reserves at the various depots at the point where it is likely to be used, altogether apart from that.

1317. You say that in 1919 you began to charge the Tramway Department with freight on their coal, and you give the additional amounts included in the value of the coal as ranging from £15,000 to £82,000 in 1924?—Yes.

1318. Does that mean that that is an additional revenue of £82,000 to the railways?—The Chief Traffic Manager would get credit for that freight.

1319. That is, £82,000, which in 1913 or 1914 would not have been revenue, although you would have carried it?—So far as I know, but I am not quite sure on that point; I did not have the handling of this business at that time.

1320. Anyway there is a charge made now, which was not made ten years ago?—That is so. I think good reason can be given for that, in the fact that we are selling large quantities of electricity in bulk, and it was in order to arrive at the actual cost of the production of electricity that that arrangement was made.

1321. You mean that the power is obtained from the Tramway Department?—Yes, and to arrive at the actual production cost of the power, it was thought necessary to take the full freight rate for the coal used by the power-house.

1322. You have had some little trouble in connection with some of your examinations in the last two years, have not you, in regard to some stacks that were short. For instance in January, 1923, there is a record of £3,000 short in steel plates at Newcastle; also other shortages. Was that at a time when you had any control over those?—That was just prior to the time when we took over from the trust system, and I brought those stores directly under my control, and we amalgamated the locomotive and the permanent way stores, and they are now under the control of my officer. It was when we went into a thorough stock taking there that we located that shortage.

1323. It was pretty serious, was not it?—Yes, but I think it was only a matter of figures. I do not think for a moment that the material ever went off the premises; I think it had been used and no record made of it—in fact, that is what our investigations proved eventually.

1324. Even in regard to as late as February this year there is a minute where you state that you have located over £19,000 worth, which was now taken on the books?—That also refers to Newcastle.

1325. Have you your own stores representative up there now—one of your own people?—Yes, my officer is in charge, and the whole position has been straightened out, and I am sure we have got to the bottom of it.

1326. Does not it rather point to the necessity for your taking direct control in other places?—It does, and we recognise that, and we are taking over the control as rapidly as we can.

1327. Sir VINCENT RAVEN: Do I understand that you are not responsible for these stores outside of Sydney, except Newcastle?—I am not directly responsible for them; they are under the control of the head of the branch, who holds the stock in trust for the Comptroller.

1328. Then he is under you. You call yourself the Comptroller?—Yes.

1329. You say he holds the stock in trust for the Comptroller—that is for you?—Yes.

1330. And, therefore, you are responsible?—Yes. I feel my responsibility.

1331. But you are not responsible, nor is the responsible officer over the trust stores, for the amount of stores

Witnesses—F. C. Garside, 21 July, and W. Carroll, 23 July, 1924.

used?—Well, I do all I can to check up the issue of the stores from the trust stores each month.

1332. I do not know whether I make myself clear. You are not responsible—nor anybody under you—for the amount of stores used, *i.e.*, if I am requiring in my department stores out of these trust stores, I can order what I think is necessary?—You can, but still there would be a check on the business each month from the information that I get from those particular branches.

1333. But you do not hold yourself responsible for me if I use a certain amount of white metal, do you?—No, but if I found—in fact I did find it necessary to write to the Chief Mechanical Engineer quite recently as to a very heavy increase in the consumption of white metal packing at Enfield.

1334. Then would you consider yourself a better judge of the amount of white metal to be used than the Chief Mechanical Engineer?—No, but my position is probably a little peculiar compared with that of previous comptrollers; I came from the Locomotive Branch and therefore have a very fair knowledge of its operations.

1335. But there can be only one person in control of a department?—Yes.

1336. The Chief Mechanical Engineer is surely the proper person to decide how much particular stores is necessary and how much is not?—Yes, but I think you will agree that the Chief Mechanical Engineer would welcome my calling his attention to what appeared to be an unusually large issue in certain lines of material.

1337. That is not a matter for me to give an opinion upon; I only want to know the facts; but apparently you do hold yourself responsible as a check on the amount of material that is necessary to be used in the Chief Mechanical Engineer's Department. Is that what I understand?—Yes, I feel that I am responsible until the material is properly used.

1338. And is that for all kinds of stores?—Yes, so far as I can check it.

1339. Would not the Chief Mechanical Engineer decide what was scrap and what was not?—Yes, he does decide it.

1340. Then he is entirely responsible for any of the scrap handed over to you?—Yes.

1341. I rather understood you to say that you held yourself responsible for seeing that all the scrap was handed over?—It is done through the local officers; for instance, it is obvious that for certain lines of scrap there is only one place, and that is at headquarters or where

it can be sold; and whilst our inspectors are there they confer with the C.M.E. Officer and reach a decision as to what is to be done with the scrap.

1342. Yes, but my point was, what is scrap and what is not scrap?—That must be entirely for the Chief Mechanical Engineer to decide.

1343. Therefore all you can see is that what he decides is scrap should be handed over to you to be sold?—Yes.

1344. You have just told me you hold yourself responsible for the amount of stores consumed, to a large extent. Does that apply to coal?—Yes, I feel I must take an interest in the consumption of coal.

1345. Do you consider the coal consumption is high or low, satisfactory or unsatisfactory?—As a matter of fact, on the whole I think it is better than it has been for years.

1346. I do not know that that is quite an answer, is it?—You see I am in touch with the figures, because they are reviewed each month, and I have a fair idea of how the business is going.

1347. You hold yourself responsible as to the amount of stores consumed. Is the amount of coal consumed good or bad, in your opinion?—I do not quite get what you are anxious to get from me.

1348. I judge from you that you hold yourself responsible for the amount of stores and various goods that are used?—Yes, I feel I have that responsibility.

1349. I am asking you particularly about coal. Are you satisfied that the consumption of coal is high or low, satisfactory or unsatisfactory?—I would say that it is satisfactory. I know that it is carefully watched.

1350. With regard to the amount of coal which is in stock on the ground, is there any measurement as to the amount that is taken up?—Yes, there is. It is only approximate.

1351. Will you tell me how it is done?—In many cases it is lifted simply by a shovel into the truck, and the truck is then used as a stage to load it on to the engine. Therefore the whole thing is only approximate, and to get at the actual weight on the ground can only be done by regularly measuring it up.

1352. It is very approximate?—Yes, adjustments are certainly necessary after the stocktaking.

1353. So far as you know, the coal is not measured either from the coal stage on to the locomotive, is it?—No, although we have a fairly accurate gauge of it with our overhead bins.

1354. That is still approximate?—Still approximate, yes.

#### TENTH DAY.

WEDNESDAY, 23 JULY, 1924.

(Held at Chief Secretary's Building, Macquarie-street, Sydney.)

COMMISSIONER :

Sir SAM FAY.

WILLIAM CARROLL, Director of Statistical Bureau, New South Wales Government Railways, sworn, and examined:—

1355. Sir SAM FAY: I understand you are responsible for not only the statistics of the New South Wales Government Railways, but you are also the head of the inter-State Bureau?—That is so.

1356. You take both?—Yes.

1357. The cost of the inter-State Bureau being divided between the different States in proportion to what?—No, on a flat rate, each State contributes an equal amount.

1358. The assumption being that the work is about equal?—Well, practically so.

1359. In your statement you say that you take the information for operating statistics from the combined drivers' and guards' daily reports?—That is so.

1360. Do you check those against any other return?—Yes, against the loading returns and the guards' train journals.

1361. The loading returns from the stations?—The daily loading returns which are submitted—not from the whole of the stations, but from the principal depot stations in the State.

1362. And the guards' journals?—Yes. In connection with the guards' journals, we do not check the whole of them, but we make periodical checks to satisfy ourselves in

Witness—W. Carroll, 23 July, 1924.

respect to the loading shown on the drivers' sheets and the journals, if they agree or otherwise. In that we have not found any discrepancies to create any disturbance at all; we can take it practically that that information is on a good footing, solid and sound.

1363. You are satisfied that those reports are correct?—Yes.

1364. You think from your experience there is not much doubt about it?—Yes.

1365. Have you noticed something which I thought rather extraordinary, that in the loading statements, the train load, very frequently the exact maximum tonnage was shown as being conveyed?—Yes, that is so. We have looked into that recently, and we found a little difference in that respect, but not sufficient to create any disturbance in the compilation of the figures when we are getting out the percentages.

1366. The impression left on my mind was that it was not actual, but was computed by the guard, as it were—he would say "the maximum is so and so, I have the maximum, and that is the tonnage I am going to put up?—He computes his load, of course, from the weights of the individual vehicles on his train, and the stations also, in compiling their daily loading returns—that is the same source of their information; and whilst in a good number of instances it may come right out at the exact figure shown for the maximum load of the train, a ton either way would probably not be taken into consideration, or 2 or 3 tons.

1367. It was so often in a return I saw that Mr. Hodgson produced—so often the actual maximum load was conveyed, to a ton?—That is on the daily loading returns. We checked those very carefully.

1368. I think these returns were from the guards' and drivers' statements?—The loading returns would be submitted by the depot stations.

1369. I do not think that was so?—If that were the form presented by Mr. Hodgson, I think that would be the form, a daily loading return—a large white sheet about that size (*illustrating*.)

1370. I do not know; we had it in a condensed form. Of course, one knows from practical experience that a return might be made up quite accurately by a guard at 2 o'clock in the afternoon, but at 2 o'clock in the morning it would not be so accurate. I mean, it is an actual result of the physical condition of the man?—Yes. I think that the information we get on the drivers' sheet and the guard's journal is practically correct. We have checked those documents with the train itself, and we find them to be practically correct. Of course, some of the guards may go a little bit wrong in their additions; if a man has thirty or forty vehicles on his train of different weights he may make a little mistake there, but we pick that up in the bureau, because we even use mechanical aids to check his addition.

1371. You see what I am driving at—to ascertain if you are quite satisfied that the basis of your statistics is correct?—Yes, perfectly satisfied. I do not compile the loading of trains for the operating statistics from the daily loading returns, I use the figure that we build up from a combined sheet that I have referred to, and we check the others by it to see if they are keeping up to what we are handling.

1372. How soon after the information gets into your hands do you supply the operating officers with these statistical figures?—Between the 15th and the 18th of the month following—that is the complete returns, but there is lots of shunting mileage; we give that weekly, about the 4th day following the close of the week in which the information is compiled.

1373. But your complete returns are not in their hands until the 15th of the following month?—Any time between the 15th and the 20th.

1374. Does that mean that your figures for this month of July will be in their hands in the middle of August?—Yes.

1375. I think we had some evidence that they were not produced until six weeks after date?—I do not know where you would get that evidence.

1376. Well, it was certainly given by somebody; I think it was Mr. Hodgson?—We have practically the whole of them completed and distributed to the whole of the officers for their monthly conferences, which generally take place any time between the 20th and the end of the month.

1377. This is what Mr. Hodgson said, speaking of statistics generally:

A. I got certain information, yes. Q. How soon do you get that information after the actual work? A. I suppose it would be about six weeks. A. It is earlier than that. That is, if he is referring to the operating statistics; he may have some statistical information in regard to his own operations that he may get six weeks after the period.

1378. This arose on a question with regard to the miles per hour that he got out of an engine?—Yes, well, we have that any time between the 15th and the 20th of the month.

1379. Then he was wrong in that, because, according to his evidence, he says, "I suppose it would be about six weeks"?—He says he supposes. Those returns are all dealt with at the Commissioners' conference, before the close of the following month for which they are submitted, and they have them in their hands some considerable time before that.

1380. Well, I wish you would reconcile your evidence, will you, because all we want to get out here are the facts?—Do you wish me to see Mr. Hodgson, or bring something before the Commissioners to reconcile those statements?

1381. If he wishes he may correct his evidence, if it is wrong?—Yes.

1382. In addition to the statistical business, you deal with the Suggestions and Inventions Board?—That is so.

1383. That is a comparatively modern department, is it not?—It was brought into operation about 1915, I think—I am not sure of the exact date. It was then run under a committee; an officer of each branch was a member of the committee. We took over the operations of the board in 1920, as shown there.

1384. It seems to have been very successful?—Very successful.

1385. I should like to ask one question with regard to how you deal with patents for your men. This is their invention?—Yes.

1386. You take out for them letters patent?—That is so.

1387. You have the free use of the invention for the railways of New South Wales?—Yes! they give us a conveyance to that effect.

1388. That is a practice which is a common one in England too, and elsewhere, I know. But are they at liberty to deal with the invention in the other States?—Yes—and we help them in that direction, too, by placing it before the other administrations.

1389. And if it is an invention of a New South Wales railway employee, he gets paid by any other State using the invention?—Yes. If they adopt it or can use it they will pay him a bonus in accordance with the scale they have in operation. We also pay him a bonus here as well, after we put the whole thing through for him; the Commissioners pay the whole of the fees in that connection, and in addition pay him a bonus on what we find is the value of the patent on the first year's saving; we can pay up to 100 per cent. on the first year's saving; that is, give him the whole of the first year's saving, for the patent.

1390. Then he is free to do what he likes with his invention outside the railways?—Yes.

1391. Supposing a European or an American railway administration wished to make use of it, he would make his own terms?—Yes, he could make his own terms with them.

1392. Do what he liked?—Do exactly as he liked.

1393. Sell his patent in any way he thought proper?—Just so.

1394. Then you have under you the advertising branch as well?—Yes.

1395. You make the contracts for advertising?—The whole of them.

1396. And you collect and remit the cash?—We do the whole business, collect the moneys and remit them to the cashier, after audit by our own auditor and the Auditor-General.

1397. They are audited by whom?—By our own traffic auditor, as well as the Auditor-General.

1398. The Auditor-General really comes into your branch?—Comes into my branch in order to look over the accounts—the contracts and ledgers and accounts.

1399. Do you deal with bookstall receipts?—No. The bookstalls are leased. We do not get any receipts other than the amounts that they are leased for.

1400. They come under Mr. Hunt, do they?—The estate agent. They are leased to the New South Wales Bookstall Company; the Commissioners are not operating the stalls themselves.

1401. I should just like to ask you one or two things about the statistics published in the annual reports of the Commissioners. I suppose you are responsible for those figures?—We furnish the statistical figures, or a great portion of them, to the Chief Accountant; he really compiles that report.

1402. I notice that in the report for the year ending 30th June last year you give the average per passenger per mile in the suburban areas—I presume Newcastle as well as Sydney?—That would be included in that figure, the suburban area.

1403. As 61d.; and in the case of country passengers you give it as 1'01d. That is for second class. Is that difference due to the higher charge per mile in the country?—The country fare would be higher than the suburban fare; but it is the greater distance and the greater fare per passenger, as against the suburban passenger. In the suburban area it would be short journeys; the country passengers would cover longer journeys.

1404. Surely a shorter journey would be dearer per mile than a longer journey?—Not so. The suburban rate would be a bit less than the country rate.

1405. You have a very large number of season ticket holders in the suburban area. What is your calculation with regard to the number of journeys a season ticket holder makes per week or per year?—We credit them with two per day.

1406. For how many days per week?—Seven days.

1407. Seven days?—No, six days. On all periodical tickets we credit them with two journeys. That is compiled by the traffic auditor, and I am speaking a little bit from memory in that respect, in regard to the number of journeys credited on the various classes of periodical tickets. He handles the ticket side of the business, and the revenue, of course, too.

1408. You are assuming that every season ticket holder travels every day in the week except Sunday to and fro?—To and fro.

1409. Do you think that is correct?—I could not say definitely. Some, of course, probably travel more than two journeys, and I think on the whole it would be just a fair assumption to take it on that basis.

1410. We are speaking now of the suburban, of course?—That is so.

1411. And you think that on the average a man would travel every day of the week?—The great bulk of the season ticket holders, of course, are business people, coming into the city.

1412. Do they work on Saturdays, all these business people of Sydney?—Yes, Saturday is practically a full business day in the city here.

1413. What is your calculation with regard to a workman's ticket?—The same with a workman's weekly ticket, two journeys a day.

1414. Do you calculate he travels six days per week?—Yes.

1415. Are you doing the same with regard to your country season ticket holders?—No. The scale on that is a little bit different; just what it is from memory I could not quote to you. That is the traffic auditor's side of the business, not mine.

1416. But you are the statistician; does this not come under you?—No. He gives us those figures of the number of journeys, and then we put it up against the mileage, and so forth. We do not handle the whole of that; we have to get that figure from our traffic auditor. I can get you the scale, of course, but I am not quite familiar with the arrangements in relation to the number of days for season ticket holders—commercial travellers, and so forth.

1417. You would not expect a country season ticket holder to travel to and fro every day of the week, would you?—No.

1418. Of course, what I wanted to get at was the basis on which you arrive at these figures—to see what was the difference between your country and your town charges?—Yes.

1419. I assume that in these suburban figures, and the country as well, although it says ordinary passengers, it means excursion passengers as well?—The whole would be in there.

1420. So that it is not strictly accurate to say that ordinary passengers number so many?—Not in that sense; it is not strictly accurate.

1421. You would be having a large number, I suppose, in what are termed ordinary passengers—a large number would be really taking excursion tickets?—That is so.

1422. Your first-class traffic has had a tendency to decrease, has it not, of recent years?—Yes. The heavier traffic, of course, is the second class, and it is gradually increasing and the first class decreasing.

1423. Figures that are published with regard to Victoria and New South Wales—you are responsible for those, are you not?—We collect them, and bring them together. You will notice the first-class traffic in Victoria is very much heavier than in New South Wales—in fact, it would be about nine to one.

1424. There is a difference in some of the charges in Victoria, to the advantage of Victoria, according to the figures that are published?—I think, taking it on the average, the difference between the first and second class fare in Victoria is about 51 per cent.; in New South Wales it is somewhere in the vicinity of about 60 per cent.

1425. That difference would have the effect of reducing the first-class traffic?—I think so.

THOMAS CROUCH (Publicity Officer, New South Wales Government Railways), sworn, and examined, as under:—

1426. Sir SAM FAY: This department of yours is a comparatively new one?—Two and a half years.

1427. Amongst other things, I see from your memorandum you send to foreign newspapers?—English newspapers.

1428. Regular statements of the financial position, and details of the operation of the railways here?—Yes.

1429. You have evidence that this work has had an important influence in maintaining the stability of the State's credit?—We have heard it remarked that it has had such an influence.

1430. I suppose you rely upon the figures showing the profits on the operation of the State railways?—Yes—our own official figures. Financial statements have been issued quarterly, really, and one annual statement—the last annual report. A summary of the last annual report was

Witnesses—T. Crouch, 23 July, and J. Spence, 24 July, 1924.

sent, and a summary of each quarterly report this year has been sent. Then in between times there have been other statements sent to England, indicating the results of various operations, as disclosed in our own statistics.

1431. You find that publicity of that sort is acceptable to and rather sought for by the press?—Undoubtedly. They appear to be very willing indeed to get it and to display it. A number of the English papers have given us really excellent treatment in that regard. The *London Financier* and the *Bullionist*—papers of which I have no personal knowledge, but which I have heard stand rather high in financial circles in London—have apparently received the information with avidity, because they have displayed it prominently and headed it up well; I have had cuttings sent to me by the next mail here.

1432. You are responsible for a publication you call *The Staff*, a monthly magazine?—Yes. There has been, as I have said there, for many years a magazine published in the department. It was confined to the membership of the Railway and Tramway Institute, but with the beginning of this year the whole scheme was reorganised, under my supervision, and the magazine is now distributed to the entire staff of the railway and tramway services; it now runs into 50,000 a month, whereas its latest previous circulation was 21,000.

1433. Is it sold to the public as well?—We are just now beginning to make it available on the bookstalls. We have had a few inquiries from outsiders as to where the book could be purchased, and in order to meet that demand, and also to test whether there was likely to be any substantial demand, I am now putting it on the bookstalls and advertising it by poster displays. I would be very pleased to supply the Commission with a complete file of that magazine, if they are at all interested.

1434. We have seen it. You say that the work of publicity is extending to embrace an active supervision of all departmental publications?—Yes. That is, apart from the technical publications; I do not mean the weekly notice, for instance, or the time-tables; although in connection with the time-tables, I have been recently called into conference with a view to cutting down the size of it, if possible, without eliminating any necessary features. Our time-table, as you have probably noticed, is getting rather bulky for a pocket book—the idea being that it should be a book that could be put into the pocket—and I have recently been called into conference on that matter.

1435. The total cost of your operations, I see, is not very much?—No, it has been rigorously kept down.

1436. £1,500 a year?—Yes, £1,500 will more than cover what it has cost for my operations.

#### ELEVENTH DAY.

THURSDAY, 24 JULY, 1924.

(Held at Chief Secretary's Building, Macquarie-street, Sydney.)

#### COMMISSIONERS :

Sir SAM FAY.

Sir VINCENT L. RAVEN. /

JOHN SPENCE, Director of Finance, sworn, and examined, as under:—

1437. Sir SAM FAY: As you know, we have been asked to report on the railways and tramways of New South Wales?—Yes.

1438. We find a good deal of difficulty in connection with finance. This is a very large business in which the Railway Commissioners are engaged; it is not only the running of the railways and the tramways, it is a big manufacturing business as well, such as you very seldom find in connection with railways; also it is on a very considerable scale, and it is evidently intended to make it still bigger. Now, we have come across, in many directions, evidence that the efficient and economical working and building of new railways and of works cannot be carried out under the existing financial system. We are told that they are held up very often from the end of June until November, because under one of your Acts, until the budget is passed, they are not supposed to spend more than they did in the previous year during that particular period. Then again we find that works are held up because money is not available. We want your help, in telling us whether you think that one of two propositions—or either of them—could be fitted into the framework of your present financial organisation.

WITNESS: I should like to correct something you have said, which does not appear to me to be quite right—i.e., the statement that works are held up until the estimates are passed. That, as applied to works in progress and already provided for, cannot be right, because they are always allowed to go on spending at the same rate as the previous year, until the estimates are passed; or if more money is required than was provided at last year's rate of expenditure, they may ask for it, though they will not always get it. I only wish to make that correction in regard to works that are held up: I cannot see that; the works can always progress in accordance with whatever appropriation has been made for them—perhaps I should

use the word allocation in lieu of the word appropriation—the works can always progress in accordance with whatever allocation has been made for them.

1439. Sir SAM FAY: You are differentiating between new works and ordinary maintenance work?—No, I am even speaking of new works. For instance, we are just beyond the financial year ended 30th June last, and there are no estimates passed yet. The Railway Department—and all other departments—are going on with their loan work at the same rate as they did last financial year—that is, on new railways; so that they are not held up in that way, though it is true they cannot go on faster.

1440. That is not quite in accordance with the evidence which we have had before us, and, presently I will read to you extracts from minutes which have been made by the officers dealing with these particular new works—but with regard to the ordinary maintenance work in the railways, do you say that there is no difficulty as between June and November in regard to finance?—No. Railway maintenance is provided from revenue; new works are provided from loans; what I said a moment ago had reference to loan works. With regard to revenue work, that is provided for under the Audit Act. Automatically there is three months' supply voted from the 1st July, under the Audit Act, and that supply is at the rate of one-twelfth of the previous year's appropriation; so that at the same rate that they went on the previous year they can go on, pending the passing of the estimates.

1441. But that is exactly the point, is it not—i.e., that assuming that in, say, June, July, and August of last year, they were spending at a certain rate, and that this year, for really essential purposes it is necessary to spend, say, 25 per cent. more—under your Audit Act they could not do it?—That is true. It is true to this extent—it is not exactly what they spent in the previous July that governs it; it is that they cannot spend more than one-twelfth of their yearly appropriation. If the expenditure went evenly throughout the year what you have said would be

correct, but as a matter of fact I do not suppose it really does. If you take their yearly appropriation and divide it by twelve, that is their limit of expenditure for any month, under supply.

1442. Then there is obviously a good deal of pressure put upon the Commissioners to reduce expenditure?—Well, I have to distinguish between loans and revenue, you see. As regards loan works, there is a good deal of pressure to keep their expenditure down; as regards revenue, I know of no pressure, except that they must keep their expenditure within their revenue.

1443. It goes beyond that, does it not, if it is only one-twelfth up till the time that the budget is passed?—Well, of course, that is only temporary.

1444. But it might have a serious effect if acted up to strictly?—I do not think so—I do not think that the effect can be very serious, because there are ways of exceeding that; e.g., in special cases they can have recourse to the Treasurer's Advance Account. I may say that that course is discouraged, because the Treasurer's Advance Account is a limited amount and has to provide for all emergencies; still, there is sufficient elasticity in regard to revenue to provide for emergencies.

1445. Do you say that, so far as you know, there is no pressure placed upon the Railway Commissioners to reduce their expenditure?—As I said before, I have to distinguish between loan and revenue. As regards loans, there is pressure, because there is only a certain amount of loan money available, and that has to be allocated to the Railway Commissioners in common with other departments. With regard to revenue expenditure, I know of no pressure which is applied to the Railway Commissioners, except to keep their expenditure within their revenue.

1446. Mr. Fraser, when giving evidence on financial matters, read a letter which had been written to him upon the subject of expenditure, and it showed that there was considerable pressure brought to bear upon him?—Of course, departments are always told that their expenditure must be kept on the lowest possible basis, but so far as the railways are concerned—and I can only speak from my own experience; I have only been about eighteen months in charge of the Treasury—my experience is just as I have stated it, namely, that we put no pressure on the railways in regard to expenditure, except that they must keep it within their revenue.

1447. When you say within their revenue, do you mean the actual working costs, plus 5 per cent. interest on the capital?—It would be their actual working costs, plus their share of the interest, but the rate is not always 5 per cent.; it varies from year to year.

1448. But it would mean that they would be expected to be earning 5 per cent. interest on the capital invested in the railways?—Yes; it was £5 3s. 2d. per cent. last year, I think.

1449. This (*indicating*) is the letter which Mr. Fraser read to us, and to which I have already referred:—

The following copy of communication, dated 23rd August, received from the Director of Finance, is forwarded for favour of attention by your Commissioners:—

"Your draft estimates for 1923-24 are returned herewith for favour of revision. The total estimates received from all departments exceeds the estimated revenue for the current financial year by fully £1,500,000. It therefore becomes necessary to reduce them by that amount. The Colonial Treasurer desires that you will be so good as to give this your urgent personal attention, and let him have your revised estimates at the earliest possible moment. It is imperative that all departmental estimates be reduced very considerably, and only essential items included. Your estimate of expenditure exceeds your last year's expenditure by £146,575. Owing to the increase in salaries, payment for interest and other statutory payments, the contingencies expenditure must be brought very considerably below that of last year. It will be observed that the 1922-23 expenditure column is incomplete. Will you please have the remainder of the figures filled in against the respective items?"

That shows pretty considerable pressure, does it not?—It wants a little explaining. That was a circular letter, to

the best of my recollection, which was sent round to all departments, including such departments as the Lands and Agriculture Departments, which are not in the same position as the Railway Department, and, despite that letter, I know of no pressure on the Railway Commissioners to bring their expenditure below their total income. Their expenditure is supposed to cover, also, interest on the capital.

1450. Of course, you are dealing here with a big business?—Yes.

1451. It is not an ordinary department of State; it is a commercial undertaking?—Yes.

1452. It is pretty obvious to us that to try and run a business on the basis of the yearly budget, which is dependent for some months upon income, as you put it?—Yes.

1453. And which has to cover not only actual working expenditure, but also interest at the rate of 5 per cent. on the capital, is a system which does not lend itself—cannot lend itself to economical working?—That proposition may be perfectly true; I have not considered it, but I think that in arriving at any conclusion on a proposition of that kind it should be borne in mind that the result of the railway working, so far as the Treasury is concerned, for a number of years and until the last two financial years, has been a deficiency, and it is obvious that in those circumstances pressure would be brought to bear on the Railway Commissioners to keep their expenditure down.

1454. But the effect of keeping expenses down is not economy; I mean, it is not what one would do in business. However, I am not suggesting that there is anything peculiar about New South Wales finance. This sort of thing, we know, has arisen in pretty well every other British railway organisation which is under the State, and, up till now, I am not sure that anyone has really got out of the difficulty of running a business through the State with a yearly budget. Well, what we should like you to help us in is this: to tell us whether one or either of two methods could be adopted, in view of your present financial arrangements. Of course, we know that if either of those propositions is carried into effect, it will be necessary to get Parliamentary sanction for it. First of all I will put this question to you: Would it be possible to have a separate budget for the railways—a budget which should be passed for, say, five years, so that there would be continuity of expenditure, thus enabling works to be carried on, and then to carry on their day to day work without any fear of interruption from the Treasury?—You are referring now to what we call the revenue side of it, namely, working expenses.

1455. Yes, we will put it that way?—We will take the working expenses which are chargeable to revenue. It could not be done without a new Act, of course. Anything could be done with a new Act.

1456. Would there be any great objection to that on the part of your department?—I have not given that subject very much thought. I believe it has come up before my time in the Treasury, and the Treasury officials in those days opposed it. I do not know fully the grounds of their opposition, but no doubt it was dictated to some extent by the fact that the railways usually showed a deficiency, and the general revenue had to provide that. I only assume this, and that while it was so there was pretty good reason for keeping the railway finance within the general revenue.

1457. Of course you appreciate, I am sure, that if you build lines enough in the country, and you have to wait some years before you get a return upon them, that you could pretty well break down any system if you built enough lines—that is, if you went on building unremunerative lines—because that is the real reason, is it not, why they did not pay the full interest which the State had to pay on the loans raised for railway purposes?—Well, I could not say that of my own knowledge, but that

Witnesses—J. Spence and O. W. Brain, 24 July, 1924.

is what everybody thinks, and that is what the Commissioners say, I believe—that they have certain developmental and unremunerative lines. That is part of the reason; then I should say that another part of the reason is that lines are not always carried to completion, and that they cost very much more than they ought to cost by reason of their being suspended—not only once, but sometimes several times.

1458. That is exactly the point that I was coming to—that when you start new lines of works, they are started and then they are held up?—Yes.

1459. Then you have material lying on the ground, with all the capital which has been put into it lying idle, and then presently they go on again; that is just the thing that impresses Sir Vincent and myself, *i.e.*, that there is no continuity, and that in consequence there is, without doubt, great loss?—Yes.

\* 1460. It is that state of affairs that we want to suggest should be altered by the introduction of financial methods different from yours of to-day?—Of course, you cannot cure that unless you take it wholly away from political considerations—policy considerations. I do not know to what extent the Government can now dictate the construction policy, but while the construction was under the Public Works Department the Government dictated the construction policy, and, to a very large extent at any rate, the Government still controls it, because it controls the finance, and it can say how much money is to be allocated to railways for loan expenditure.

1461. Per annum?—Yes.

1462. When it is decided to build a new railway, or to carry out new works on loan account, is there a vote of the House for the full amount, or only for the year's expenditure?—Only for the year's expenditure.

1463. Well, here is another proposition we will put to you, to get over the difficulty: would there be any difficulty in entirely separating the railway and the tramway side of finance, putting the whole thing under the Commissioners, the Commissioners taking over the responsibility for all existing loans which have been issued for railway purposes, raising their own capital, keeping their revenue and dealing with their own expenditure—still under the State, of course?—I do not think I could answer that question without consideration. The only Treasury difficulty is legislative; but there might also be policy difficulties, as to which I am not prepared at the moment to express an opinion.

1464. Of course, we do not overlook the fact that it you take away the railway side from your budget, more than half of it is gone; it becomes a comparatively small budget depending upon taxation?—Yes, but as they draw out practically as much as they spend, there is not very much in that. You see, the general revenue gets very little benefit from any surplus from the railways.

1465. It is quite possible that under the efficient working and management which would be carried out by a continuous policy the State would get—as in the case of India—a very large revenue?—You mean a very large surplus?

1466. Yes?—Taxation always follows the balancing of the revenue and expenditure, and I take it that if such a thing happened the general taxpayer would get the benefit of any surplus like that, whereas, under the separate system, the user of the railways would get it, because the Commissioners would, presumably, keep their fares and freights down, it being a State concern, to just the amount required to carry on.

1467. Still, the community would get the advantage of that, would they not?—Undoubtedly; but any opinion of mine as to whether it is better for the general taxpayer to get the benefit of it or for the user of the railways to get it I do not think is worth very much.

1468. What we wanted you to help us in was in the direction of telling us whether you saw any difficulty—assuming that the necessary Act is passed—to carry out

either of those propositions?—I do not think there is any real difficulty, subject to having the necessary legislation, in making satisfactory arrangements for separating the railways and giving them complete control of their own finance—there is no machinery difficulty. As a matter of fact, that is likely to be done during this session with the Water and Sewerage Board, which, until recently, has been in exactly the same position as the railways; but there may be very grave policy difficulties, which I have not considered. I do not see how an official can say more than that.

(Witness retired.)

ORLANDO WILLIAM BRAIN (Chief Electrical Engineer, New South Wales Government Railways), sworn and examined, as under:—

1469. Sir VINCENT RAVEN: You are Chief Electrical Engineer, New South Wales Railways?—Yes.

1470. How long have you held that position?—I have been in charge of the branch a little over twenty-five years.

1471. You have under you the power supply and distribution in the tramways; lighting; stationary electric motors and equipment; the purchase and maintenance of motor-cars, typewriters, clocks, watches, &c.?—Yes.

1472. You supply your power from three main generating stations, viz.: Ultimo, Sydney; White Bay, Sydney; and Newcastle?—Yes.

1473. At Ultimo station your output is 67,653,864 millions?—Yes.

1474. The cost of generating works out at .5851 of a penny, at Ultimo?—Yes.

1475. And your maximum kilowatts, 36,500?—Yes, the plant.

1476. And your maximum kilowatt one-hour loading is 22,000?—Approximately.

1477. At White Bay the output is 76,585,600?—Yes.

1478. And your cost there, .4096 of a penny?—Yes.

1479. And your machines, 21,000 kilowatts?—Yes.

1480. And your maximum kilowatt hour is 18,000?—Yes.

1481. Those are the two stations at Sydney, and you supply from those stations power to the railways and tramways?—Yes.

1482. And there is also a certain supply to outside sources?—Yes.

1483. You have agreements for the supply of current to outside sources—I presume those are varying agreements?—Yes.

1484. I do not want you to tell me what they are in any detail, but I should like you to tell me, broadly, how they are based?—They have been based on the estimated cost, taking into consideration the location of the point of supply and the cost of current at the time. In connection with the City Council, which is by far the most important service, a very special investigation was made as to the charge. When the new agreement was made between the Commissioners and the City Council for their future bulk supply, the Chief Electrical Engineer to the City Council told me that the only conditions which would be satisfactory in the matter of supply were such as would give his business the advantage of their own load factor, also the improvement on the load factor of the power-house as a consequence of his supply. The whole thing was regarded as co-operative when the matter was first mooted, and Mr. McKay came to me and said that one or other of us could supply the power, and he was quite prepared that the Commissioners should supply it because of the advantages they had, and therefore it was discussed on a co-operative basis; and he asked me to try to give him a formula which should be a basis of charge, on which he would be able to see that he had the benefit of those two factors. I have here the agreement containing the clause upon which the present charge is based (*handing copy of the clause to the Commissioner*).

1485. I suppose this agreement was based on the expectation of carrying a certain profit to the Railway Commissioners?—Yes, it allowed them 10 per cent. profit. Well, that practically was profit and contingencies. The costs were made out as finely as we could make them, and to that was added a clear 10 per cent. on our estimate. That is, so far as the City Council is concerned.

1486. Are there any other sources of supply?—I mean, are there any other places to which you supply current?—Yes, to St. George and Bankstown, and others.

1487. But, my point is, that outside those there are other places to whom you supply current?—Yes.

1488. Have they any alternative source of supply?—No, they have not; it is not available. In some cases they are within reach of the City Council supply, but they are dependent upon the railways.

1489. The City Council is supplied by you?—Partially, but they also have a large power-house of their own.

1490. You supply people outside the City Council?—Yes.

1491. And the City Council also have a supply of their own?—Yes.

1492. And therefore these outside people could have an alternative supply from them or from yourselves?—Well, they could not, really, because the City Council require the whole of their plant for themselves, and in some cases there is not the reticulation.

1493. I asked you just now if they had any alternative source of supply, and I thought you told me that—you said the City Council?—Well, what I mean is this: that it is not available to-day if they wanted it against a breakdown, but if they liked to say, "We will not take the supply from you, but will take it from the City Council," and made the necessary arrangements, they could do that.

1494. But, they do not exist to-day?—No.

1495. There is not a supply company from which they could get their current supposing they desired to do so, other than yourselves?—No. We have an agreement with the City Council which gives them the first right over any of the consumers in the county of Cumberland. Those that we are supplying the City Council have not been advantageously placed to supply, and we have agreed to supply them.

1496. You have various agreements with these people, carrying certain profits to you?—Yes.

1497. So far as the railways and tramways are concerned, is the current charged to them at actual cost?—The actual cost charges. A figure has been given, but it varies from year to year, and probably is not the actual cost. With a large number of people supplied, it wants a good deal of accountancy to say what is the actual cost. For instance, in connection with the future load on the railways, it seems to me quite clear that we shall have to adopt a similar method for charging the railways to that which we have in connection with the City Council, because the cost to the Commissioners will be the balance; and if that is an equitable charge—which we think it is—the balance is all that the Commissioners should pay. Now, that clause that you have there is a somewhat complicated one, and it will be better understood if I put this before you (*handing Commissioner a table of figures*).

1498. Well, I do not propose to deal with these agreements at all. I know they are complicated in a large number of cases. I only want to get at the result of your sales outside, and the result of your generating power to the railway company. Do you produce a balance-sheet showing your total costs and your total revenue, and showing the power distribution as a separate business?—No, we have not treated it as a separate business.

1499. You could give me the figures, could you?—Yes, we have all the figures, but I have not got them now.

1500. I should like to have them—say, for 1923?—Very well. Of course, it involves in many cases a number of special considerations, as where we have our own high-tension feeders running a long distance, and we supply

perhaps to the consumer—in those cases charge will be made for those feeders, and it has to be a matter of special calculation in a great number of cases; still, that can all be set out and the correct charge against them shown. The balance which remains after that is the charge which the Commissioners carry, and of course the idea is that the Commissioners shall carry their correct proportion.

1501. But, I presume, you have a knowledge of the costs of your generating plant?—Yes, it is all available, and we can show the results.

1502. Is the private supply taken fairly equally from both stations at Sydney; or is there more taken from one than the other?—At the present time there is much more of the private supply taken from Ultimo, because we have the only existing 50-cycle plant there. The private supply—that is, the City Council supply—was arranged when they were in difficulties, and it had to be done at short notice, and the handiest connection was to Ultimo; so that a power supply of something like 10,000 kilowatts to the City Council has been built up mainly at Ultimo, that is, partly 25 cycle and partly 50.

1503. I see that the largest unit at present at any of your power stations is 7,500 kilowatts?—Yes, at present.

1504. And I notice, here, that the cost at White Bay is less than the cost at Ultimo?—Yes.

1505. Although there is not a very great deal of variation between the output at both places, at the same time the number of kilowatts at Ultimo, which is the more expensive station, is a great deal larger than the number of kilowatts at White Bay?—Yes.

1506. Can you explain that higher cost at all?—Ultimo power house was the power house which was built first, and it was built on smaller designs originally, and has grown. The White Bay power house embodies the best designs we know, and as the result of some years of experience on the Ultimo plant. Then, again, the Ultimo power house, having been originally built to a smaller design, it had a smaller type of boiler—the 8,000 lb. boiler—and the consequence was that as that grew up we had as many as sixty of these boilers there the evaporation of each of which is about one-third of one boiler at White Bay. Then, again, at that time, on the advice given over twenty years ago, it was so designed that it did not admit of the installing of economisers, and therefore we cannot get anything like the thermal efficiency of White Bay. It has less than three-quarters the thermal efficiency of White Bay. The units are smaller on the average. There is one 7,500, there are five at 5,000, two of 2,000 and two of 2,500, against three of 7,000 at White Bay. Then the Ultimo units are also of an older type and older design, and are not so efficient in their operation. Then, again, the circulating water is quite a difficulty in Ultimo. At the present time we are rather troubled owing to the fact of the restricting of it as a consequence of the building of the city railway, which is heating our circulating water. We are getting an increased temperature, whereas White Bay has ample water with quite a low temperature.

1507. At Ultimo you have no economisers?—No.

1508. You have uneconomical boilers?—Yes.

1509. And you have a number of smaller units?—That is so.

1510. And you have a difficulty with your circulating water.—Comparatively, yes.

1511. Under those conditions, then, I presume you are not extending at Ultimo?—No, we are not extending at present, but I hope that the Commissioners will later put in larger units, because over a million of money has been spent there, and at the present time we are spending in order to make the circulating water satisfactory something like £130,000 or £140,000 on water ducts. It means a lot of money. We cannot afford to discard the station, and I think that later on probably the Commissioners will put in larger units—perhaps four units approximating to the latest size we are putting in at White Bay, and put in large boilers and economisers.

Witness—O. W. Brain, 24 July, 1924.

1511A. Does that not mean improving the station?—It would mean improving it altogether, because it would really mean substituting new plant.

1512. What you propose to do is to improve the circulating water and to put in larger units and put in economising plant?—That is so.

1513. But do you propose to enlarge the station in the same way that you are enlarging the station at White Bay?—No.

1514. Have you anything like that in mind at the present time?—No. The site does not admit of enlarging it to a modern super-power house, but I think the figures will probably show that it will pay very well indeed to enlarge it to the extent I have said, probably to four units of that size.

1515. But the higher cost is due to what you have stated, and do you hope to decrease that at all until you have made these proposed alterations—will you get a better load factor or anything of that kind?—At present we are not making the best load factor that might be made of our combined stations, for the reason that it is inadvisable with the present switch gear to tie the two stations together. We are incurring quite a heavy expenditure to put in modern switches which would handle any conditions that could arise with two big stations being connected like that. When we do that we shall be able to combine the two stations, and the improvement in load factor then will be rather in the direction of giving Ultimo a lighter load factor and transferring as much load as possible to White Bay, building up the load factor at White Bay because it is a so much cheaper station to operate; so while apparently Ultimo costs may be raised in the future, that will only occur with a very definite improvement in the costs as a whole of the current.

1516. Then you hope to be able to reduce the cost at both stations in the future?—Yes. That is to say, the total cost of the output of both stations—that is, the cost per kilowatt hour, I mean, for the total output of the two stations.

1516A. Then you are extending White Bay station?—Yes.

1517. And you are proposing to put in there machines up to 22,000 kilowatts?—Yes.

1518. Is that on account of the electrification of the railway or is it on account of the extended requirements outside the railway?—It is both. If we had not the city loading we should have to extend White Bay to meet the railway requirements, but as it is the power-house at White Bay will meet the requirements of the two for not a very great period of years on the present outlook.

1519. I may have to ask you a question about that later. Then part of your A.C. current is 25 cycles and part 50 cycles?—Yes.

1520. And you have transforming stations where you can bring those down to secondary voltages for workshops and signalling?—Yes, and for the traction supply. The bulk of the substations, of course, are traction supplies.

1521. Are you decreasing the 25 cycle and increasing the 50 cycle?—We are increasing the proportion of 50 cycle, but we are increasing the absolute output of 25 cycle because the Prince Alfred Park substation is 25 cycle.

1522. Are you decreasing the 25?—No. We are increasing the actual output of the 25 because we are putting in two 18,750 kilowatt units at White Bay, which will add 37,500 kilowatts to the present 21,000 and bring up the total to 58,500 kilowatts for the two reasons that the tramways, which are entirely 25 cycle at present, are increasing year by year, and portion of the railways will also be 25 cycle. Of course, I might say that had the art been sufficiently advanced when we first put out plant in, when we put in our 25 cycle, it would have been preferable to put in 50 cycle, and we should have put it in. Reliable converters for railway supply were not available on 50 cycle, and therefore the 25 cycle was being installed at that time practically all over the world on that account, but

as we developed and as the public supply must be 50 cycle, then as soon as we could we went to 50 cycle supply.

1523. Then you are not hoping in time to have a universal 50 cycle?—No.

1524. And you are not working in that direction?—Yes, we are working to make all our additional extensions, so far as we can, the 50 cycle. That is largely in the interests of the general public so that our current will be available wherever we go in the State for industrial and public purposes.

1525. I suppose that you have a large number of substations? On this return that I am looking at there are twenty-two. Are those in connection with tramways?—Those twenty-two are entirely tramways. That is a list of tramway substations.

1526. Yes—have you any automatic sub-stations?—Yes we have eight automatic sub-stations.

1527. Amongst these?—Yes.

1528. Are they working satisfactorily?—Yes, they are working very satisfactorily. We are very hopeful of extending that number and making a big saving.

1529. You are intending to increase it?—Yes, and I may say that one of my special objects in getting experience in the early stages of the automatic substations was that I thought that was probably the solution of satisfactory railway working, to be able to work the substations cheaply and thus not require such high voltage on the trolley wire.

1530. There are three substations here—Forest Lodge, Prince Alfred, and Meeks-road. Are those also in connection with tramways?—Yes.

1531. They are in course of erection?—Yes.

1532. They are for tramways?—Yes—Prince Alfred and Meeks-road are for the tramways, but they are part of the railway substation.

1533. Do you mean they are being put up for the railway or for the tramway?—The substation is to be erected for the railway and advantage is taken of the opportunity to use that centre for a distribution point for the tramways so that this loading which is shown on page 5, the normal rating shown there, is for the units for the tramways, but in that same building are larger units for the railways.

1534. You mean then that what is proposed here, as shown on page 5, are for tramways?—Yes.

1535. But you are going to use the same substation for railway purposes in the future?—That is in the case of Prince Alfred and Meeks-road.

1536. Not Forest Lodge?—Not Forest Lodge. In fact, Prince Alfred and Meeks-road are primarily railway substations and are being built for railway substations. Of course, their function as a railway substation is very much more important than as a tramway substation.

1537. Those will not be the only substations connected with the railway electrification?—No. There will be a number of substations on the railway electrification.

1538. You have not given me those at all?—No.

1539. Because they are not, I suppose, at present in course of erection?—We are proceeding with them. I think on page 6 we have given them, and the plant for those has been ordered.

1540. I will come to those directly. In the meantime, these are partly for tramways and partly for railways?—Yes.

1541. I notice that you have storage batteries?—Yes.

1542. Why do you have those?—Those storage batteries, when they were out in, showed very good figures indeed for tramway work. Lead was cheap then, and it was very economical indeed to save in generating plant and high-tension mains, and substation plant, to carry the peak of the tramway load on the batteries, and also the batteries were used at night time to obviate the necessity for staff being on duty. But of recent years and during the war lead went up to such a price that it became impracticable, and to a large extent it was good finance to drop them out of use. The price has gone down again now and we are renewing some of our batteries and really, to some extent,

re-starting our battery practice, though probably they will never be used generally unless there are some very radical changes in the outlook. There is no probability of their being used to the extent they were before the war.

1543. You deal with those for the peak loads; that is what you had them for?—That is what we had them for originally and as a stand-by.

1544. But you do not propose to increase those?—Not to any extent, no.

1545. These four substations—I see you have got Prince Alfred and Meeks-road over again here?—Yes.

1546. Are these five substations the only sub-stations which are proposed in connection with the electrification of the railway?—With the Illawarra line, that is all that is in hand at present.

1547. Over what area does that extend?—I have forgotten the mileage out to Waterfall for the moment.

1548. But it is the first section that you are dealing with?—Yes. It is the main South Coast line and the Bankstown line also.

1549. I think we had better leave that, because we shall want some information about the electric railways, and then I think we will bring this question of sub-stations into that. I was going to ask you some questions about this 25 cycle and 50 cycle in connection with the sub-stations, but I think I will leave that until we deal with them in connection with the railways?—Prince Alfred is 25 cycle. All the other four are 50 cycle. Prince Alfred is in the city, and the bulk of our city service is 25 cycle.

1550. And that is the reason?—Yes. We had a certain amount of the 25-cycle generating plant for it and at an earlier stage we started putting in larger 25-cycle units. The 25 cycle unquestionably has advantages for sub-station work and Prince Alfred being our biggest sub-station there were advantages in having it and no special disadvantages.

1551. Is there no disadvantage in not having uniformity?—That is the only disadvantage. One would prefer to have it all 50 cycle but we cannot do that entirely because we could not alter it on the trams. We have a big load, which must remain as 25 cycle.

1552. With regard to the coal that is charged for your power stations, I see you give the average cost at Ultimo and White Bay. Is there anything in that charged to the carriage of the coal?—Yes, we are charged with the carriage of the coal.

1553. I see on page 8 of your memorandum that you are enlarging your power station at White Bay in order to deal with the bulk requirements of the City Council—their future requirements—and it appears that the whole of the extension which you are making now will only deal with their requirements up till 1930, the estimates for 1930 being 70,000 kilowatts?—Yes, and as far as our estimates for railway consumption have gone up to the present, that will be the capacity of plant which we shall be able to provide together with the railway requirements. That is to say, we shall be able to meet the visible railway requirements and that 70,000 kilowatts.

1554. It rather appears from this, though, that what you are putting in now is intended to deal with the future requirements of the City Council. Do I understand you to say that what you are putting in now, the enlargements, are intended to deal with the future requirements of the City Council together with the future requirements of the railway?—Yes, and the City Council's additional requirements commence with 7,000 kilowatts next March, so their demand comes first in point of date.

1555. But what you are doing is intended to deal with both?—Yes.

1556. And will deal with the requirements, so far as you can see, until 1930?—Yes.

1557. Have you at present in your expectation any further power-houses than these two?—Yes. I have given a statement to the Commissioners showing the requirements, so far as they can be estimated, up to the year 1937.

1558. And would that mean a new power-house altogether, or extensions over the present?—It means a large new power-house.

1559. Further away?—Yes. Our proposal was a power-house somewhere on the South Coast, in the coal district, convenient to the circulating water, of a capacity of 300,000 kilowatts.

1560. With regard to Newcastle, you have a power station there with an output of 27,232,808 kilowatts, and your equipment at the present time is 14,000 kilowatts at a cost of 4564?—We have one 7,500 and two 2,500, and one 1,500 kilowatts, 25 cycle.

1561. That is at present?—Yes. There is also a 2,500 kilowatt 50-cycle unit and a 7,500 kilowatt going in.

1562. At Newcastle you are changing your steam trams to electric?—Yes.

1563. And for that purpose you are enlarging your power station there?—Yes.

1564. To what extent are you enlarging that?—We are putting an additional 7,500 kilowatt unit there at present.

1565. And will that deal with your expected electric tramway?—Yes, that will deal with the visible load for some few years.

1566. Do you hope then to reduce your costs?—I am confident we shall. Of course, we supply the entire city there, as well as the cities of Maitland and Singleton, and their service will grow. We also have an industrial load, and that promises to grow, partly depending upon the money that is made available to the Commissioners to instal plant.

1567. Then the present power-house, together with the extension, will supply the tramways of these municipalities of Maitland and Singleton?—Yes.

1568. I should like also, if you will let me have it, a balance-sheet for Newcastle as well as Sydney?—Yes.

1569. Now I will deal with your workshops. Your principal workshops, in which you deal with all your electrical work and tramway work, are situated at Randwick?—Yes.

1570. Are these workshops self-contained or do you get any help from Eveleigh?—We get some work occasionally from Eveleigh. We get castings from Eveleigh.

1571. Metal castings?—Yes, iron.

1572. All the non-ferrous castings you do yourself?—Yes, but the ferrous castings we get from them, and the work we do ourselves.

1573. At the beginning of the financial year you put in estimates of the amount that you require in money to carry on for the ensuing year?—Yes.

1574. You send those in in June?—Yes.

1575. Do you send them to the accountant?—Yes.

1576. Then do you get the amount of money which you ask for as a rule?—Are you referring to working expenses or loan?

1577. I was referring, in the first place at any rate, to maintenance and renewals—that is, ordinary revenue expenses?—Generally I get most of them.

1578. I understand that the estimates are not finally passed and agreed to until October?—Yes.

1579. Between June and October, does that mean at all that any of the work in your shops is kept back, or are you kept fully going all the time?—That applies more to the loan work.

1580. I am still on the maintenance and renewal?—I do not think that that affects our shops much as a rule, because I think I get most of my running supplies that I want.

1581. You mentioned loan. That, of course, is capital account?—Yes.

1582. Have you in mind at all the capital account for renewal of tramway cars, or are they renewed out of revenue?—There is a special fund that I am not too conversant on the finance of, but still the renewal of tramcars, the building of new tramcars in the place of old ones, which is undertaken by the Commissioners, is held

Witness—O. W. Brain, 24 July, 1924.

up on occasions for want of funds. It does not go as rapidly forward as the programme has been laid out on occasion.

1583. Would you charge anything to capital account unless it was an increased number of cars. You have at the present time 1,600 cars?—Yes.

1584. Would you keep those up out of revenue; that is to say, when they require rebuilding, would they be rebuilt out of revenue?—We renew a new car entirely out of revenue as it takes the old car's number and takes its place. All those questions are dealt with by the Commissioners personally, whether any given charge goes to revenue or to capital charge. Of course, where a car is built in place of another car and takes the number of the old car, in that case obviously, I take it as a matter of course, it must be charged to working expenses.

1585. Then, whenever you build a new car, does it take the place of an old car unless it is for an increased service?—Oh, no. We have built a number of new cars that have not taken the place of old cars.

1586. For the same service?—It has gone in generally.

1587. Does it increase the number of cars that you have without increasing the lines which they run over?—Yes, we have increased our number of cars. In fact, they do not go together. The Tramway Traffic Manager says when he wants more cars, and more cars are furnished really to meet his wants. Occasionally, when a new line is built, that line is charged with a certain number of cars. The Minister is told when the line is being considered that a certain number of cars will be required for that line and that line is charged with that number of cars.

1588. What is the average life-time of your cars?—It is rather hard to say, because the great bulk of our service has only been in service twenty years, and we are only just beginning to lose some of the earliest of them. When I say twenty years, the city service started in December, 1899—that is just on twenty-five years ago—and nearly all of the old box four-wheel cars have been displaced. That is the old-fashioned cars in which we had about twenty-six people facing one another. Then the eight-wheel cars that we were looking at at Randwick the other day, as a matter of fact they went into service in 1900 and 1901. They have been in the service twenty-three and twenty-four years, and some of those now are being rebuilt and sent to Newcastle.

1589. Are you talking about car bodies now;—how long has your electric service been in use?—The electric service in the city?

1590. No?—I make the difference because there were one or two insignificant lines once before. There was one first at Waverley, and there was one over at North Shore, started about 1894, and they increased in number over at North Shore. Then there was a line started in 1897 down at Rose Bay, about a dozen cars. Then our main service, that was the George-street line, the first electrified city line, was in December, 1899, and that is when the great bulk of these present cars were built. I mean, that is when they started being built. The older cars become obsolete rather than worn out. We did not reach our eighty-passenger car until nearer towards 1910. That is the big seating capacity and low step. Those we are hoping will last us over twenty years.

1591. Then you have no experience at the present as to the life-time of these electric cars and equipment except obsolescence?—Except obsolescence, and as we hope that obsolescence will not operate on these we are hopeful that these will have a life of over twenty years. Of course, I might say that that applies more to the car bodies than it does to the motors. The equipment probably will become obsolete earlier.

1592. How is that obsolescence going to be dealt with annually as the time arrives, or have you any sort of reserve fund in anticipation of it?—That is a matter of the general policy of the railways, but as it has been done the material has been ordered. For instance, we have ordered hundreds of new motors to replace the old ones

The charges have been distributed by the Chief Accountant over certain periods subsequently. A number come out at one time and they take some months being put into place, and the Accountant charges those somewhat similarly to the arrangement in connection with the throwing out of big power plant.

1593. And you deal with those annually from year to year?—Yes, that is dealt with from year to year.

1594. And it is quite possible that you may arrive at a time when you will have to do a large amount of renewals?—Yes.

1595. It would not average itself out to an equal expenditure year by year?—No, and that is partly due to the fact that finances are not given to us. I made a recommendation a number of years ago to another body of Commissioners to replace a number of motors very expensive in upkeep. They were not replaced for a number of years, and the war came on and the prices became almost prohibitive for replacing them. However, they became so bad that a number had to be replaced. Then in that case it makes it a somewhat uneven charge.

1596. Do you consider your shops are well equipped with machinery?—I think so. We are improving them from year to year.

1597. Do you get all the machinery that you ask for?—Yes; not always, but generally. I think recently, in Mr. Fraser's time, we have mostly got what machinery we have asked for.

1598. Then you are quite satisfied with the machinery as it stands in your shops?—We have some old machines that we do not see our way to replace. It does not look economical to replace them at present.

1599. The value of your machinery I see is practically £150,000?—Yes.

1600. And you have expended in the last ten years £44,500?—Yes.

1601. The bulk of that was expended in 1922, when you appear to have got a considerable amount of new machinery?—Yes.

1602. With regard to your stores, are they under you or are they under the Stores Comptroller?—The stores generally are under the Comptroller?—Only small running stores are under my officers at the different locations.

1603. And anything that you make in the works that is not absolutely charged off to some particular order is put into the stores?—Yes, except the running material that they are using in the shops themselves in connection with the repairs.

1604. That is made to a particular order?—Yes.

1605. But I presume that you do make stores for repairs?—Yes.

1606. I mean to say you do make certain material into parts for repairing purposes which cannot be charged off and those go into stores to be taken out again by you when required?—Yes. That, as I understand it, is the material I was trying to describe that is used in the shops as they are going along with their repairs.

1607. Because I notice that you say here that you make quantities of each item for stock which are used as required for repairs?—Yes.

1608. It is those items which I am speaking of?—Yes.

1609-99. When you make quantities for stock which are used afterwards for repairs, do they go into stores?—I would rather the works manager answer that question. We certainly make large quantities of material which is used subsequently, which goes to the Comptroller. The Comptroller takes them over. Just the line between them and which of the material the works manager puts into his own stores I could not say. There is a certain amount. I take it it is mainly the smaller material of the smaller value which he puts into his own stores and uses as he wants, but the large quantities, running into big figures, are taken over by the Comptroller and issued by the Comptroller again to the works manager as wanted.

1700. Can he make quantities of items for stock and keep them himself under his own control and use them

when he desires?—I should say that only applies to small quantities of small value, because the stores that he has are not very large.

1701. However, your stores, with the exception of small ones, are under the Stores Comptroller?—Yes, right throughout the service.

1702. You have a very complete system of gauges in your works?—Yes.

1703. Do you work to standards throughout?—Yes.

1704. Therefore the work is interchangeable?—Yes.

1705. Does that apply to all your work, or only to the tramway work—you see, you have signalling and you have other things?—Yes, generally to all our work, but I cannot say with all the works with the same precision as the tramway works.

1706. And you find no difficulty in dealing with it in that way?—No. It is an advantage.

1707. A great economy?—Yes.

1708. I notice that you have given up colour painting and instituted enamel painting?—Yes.

1709. Was that for purposes of economy, or was it durability?—It was both. It is economy and durability, and it keeps the cars not so long out of service.

1710. Do you think in every way it is an advantage?—Our experience so far is; we feel quite sure that it has been quite a step in advance.

1711. Is your timber bought by yourself or by the Comptroller?—By the Comptroller.

1712. Is it timber which you have specified?—Generally.

1713. Is it inspected by you before being purchased, or afterwards?—Our officers certainly do a good deal of inspection, but I could not say they inspect all the timber that is bought for the tramways.

1714. I suppose somebody inspects it?—Oh, yes, it is inspected.

1715. Then you do not know whether the inspectors are under your supervision or under the supervision of the comptroller?—There is a lot of inspection which is done by my foreman car-builder.

1716. Is that after you receive it?—He goes for some inspections, but I am not very sure of my ground there.

1717. You do not know whether that is at the request of the comptroller or not?—No, but I do know that the timber receives a very thorough inspection.

1718. However, you are satisfied with it when you get it?—Yes, for the most part, but when we are not we reject it.

1719. And you work on a bonus system to a large extent in your shops, and you specify what timber you require?—Yes. More than half the men are working on the bonus system now, which we are gradually extending. It presents many difficulties, but we have a special staff on who are endeavouring to make an art of it.

1720. I notice that you have a system of what you call "cadets" in your shop, and I judge from your memorandum that they are intended for higher class work—something above the workman class?—Yes, I think there are about fifteen in the service now—though that is only a guess.

1721. Your works manager knows more about it?—Oh, no! It comes through my hands, but they disappear into the service. It has been a very advantageous system. Once a year we have an examination, and it depends largely upon the result of that what we think of these fellows when they present themselves.

1722. Is it an examination of apprentices?—No. The examination is advertised. They have to obtain the leaving certificate, and then they are required to sit for a special examination for cadets. One of my officers—a highly-qualified graduate—takes charge of that. It is an examination in general engineering and electrical work, and physics.

1723. Is that an examination which you carry out, or is it in connection with one of the universities?—It is carried out by the department at the Railway Institute under

the same conditions as other examinations. We advertise for candidates, and put them through two examinations.

1724. And you select a certain number from those candidates?—One as a rule.

1725. I see their course is somewhere about two and a half years?—It may extend to five. They can come in at 16 and stay for one year after 21. They are not at the Randwick shops alone.

1726. The passage on which I noticed it is page 28 of 69A. This puts the months in the various shops, and it totals that two years and eight months, but you say they can go on for five years?—Yes, because the Randwick training is only part of their experience. They are also given telephone and lighting training, and in the power-house and the sub-stations. This is the works manager's report, and that is all he has to answer for.

1727. What happens after those two and a half years?—They go through a similar set programme on the power side. They go through all the other sections of the department.

1728. Then do you select from those cadets officers for vacancies?—Yes, they gravitate almost automatically into useful officers. The good ones who have been under different officers are applied for by those officers, and they have made some of our best men.

1729. Do you guarantee them work?—No, but I do not think we have ever turned any cadet off. In some cases cadets have merely gravitated to quite subordinate positions, because they have not shown qualifications.

1730. With regard to your tramway system, do you get out any costs which guide you in deciding whether or not you are working economically?—Yes, complete costs are made out every month per mile, and per thousand kilowatt hours. All our costs are divided into headings.

1731. How do you judge whether it is good or otherwise?—In a good many cases we have comparisons with other parts of the world; but in recent years, I must admit, that we have compared them with our own results and endeavoured to improve our results all the time. These things can only be judged by comparison with one's previous results, or with outside results. Outside it is very often the case that the conditions are very divergent.

1732. You have to allow for that, but you have been comparing with your own self as to whether you are making an improvement or not?—Yes.

1733. And, so far as you are concerned, are you improving?—Yes, I think we are improving almost everywhere; but if not we know the reasons and provide against them.

1734. Could you let me see some of those comparative figures?—Yes.

1735. I suppose your labour costs are high as compared with those in Britain?—Yes.

1736. If you doubled them, would that be a good comparison, roughly speaking?—I should not like to say, because the conditions in England change so rapidly. A little while ago English labour costs were very high, and it looked as if we had a chance of manufacturing here, but now the English costs are apparently coming down.

1737. I do not think so!—The prices here of large machinery particularly have come down very materially.

1738. Because the English manufacturers are satisfied to work at a very great deal less profit than they have before; but, as a matter of fact, in the electrical industry the wages have quite recently increased?—There has been a very substantial drop in the prices of large units, generators, and that sort of thing. I have not in mind what would be a fair increase to put on English labour charges to bring them up to the rates here.

1739. So far as material is concerned, of course there is not that amount of difference?—Not in some materials, but there is in others. Labour charges here change very frequently; and owing to the numerous awards the department does a lot of work in regard to adjustments of wages and so on, over which we have no control.

Witness—O. W. Brain, 24 July, 1924.

1740. And the only advantage you are able to get is by some bonus system which you are using largely in your shops?—That is so.

1741. You are satisfied that your costs are on the decrease?—Yes.

1741A. Sir SAM FAY: I gather from an answer that you gave just now that you have occasionally been held up on renewal work by reason of financial stress?—Yes, I think I mentioned particularly the renewal of rolling-stock. We have been told that we could not have the money.

1742. Recently?—Yes, I think in connection with the additional cars for Newcastle. The Chief Commissioner informed me that we could not proceed on the lines we had laid down at the rate at which we had been working.

1743. Was that on renewal account or loan account?—I have a little difficulty there, because we are really renewing cars, but in place of those we are building new ones.

1744. That was surely on loan account?—Yes, the new car, I presume, is charged to loan account. Anyway, we have an additional car.

1745. Is that the only case you have got?—I cannot think of any other in connection with renewal or maintenance where we have recently been held up. I mentioned the case of renewal of motors. There is no doubt that in some of those cases the inability of the Commissioners to replace old equipment has been owing to financial reasons. There would be more instances of that kind, because we have had obsolete equipment at various times which I pointed out that it would be very advantageous to replace, but I was informed that the money was not available.

1746. That is to say, you have gone on with an inefficient machine in place of a new one which would have saved you a good deal of money?—That is so.

1747. Does the Auditor-General check your accounts?—I understand so, though he does not deal with me. We have an accountant for our department.

1748. Is he in any way under the Chief Accountant?—No, but he is answerable in his methods to him.

1749. I think you said that when you get a new tramway line the vote that you get covers the necessary cars to run that tram line?—Yes, though perhaps I had better be careful here, because there was some suggestion at one time that the rolling-stock should not be included, and I do not know the present practice.

1750. You are responsible for the telegraph instruments all over the railway?—Yes.

1751. And you have to send men out to remote parts of the country?—Yes, but it requires very little attention. They are Morse instruments, and we are not responsible for the wires outside.

1752. Would there be any difficulty in your being relieved of that?—I do not think so.

1753. You are sending men out, and the Signal Superintendent is doing the same? You look after instruments on one side and he on another, and he looks after the batteries on one side and you on another?—There is very little difficulty about that. There are only two men in the whole service on it. I offered to transfer them to Mr. Byles some time ago, but nothing was done.

1754. You have a very nice programme of new works in view, but are they all sanctioned?—The majority of them; but some have not yet received the Commissioners' approval for the expenditure of the money. I keep the Commissioners advised as far ahead as possible as to what is involved in each step.

1755. Have you a programme of construction for sanctioned works?—Most of those have a certain time in which I undertake to do them when they are passed, that is, on the assumption that we get the money.

1756. Have you ever been held up in the contract in the construction of works on account of shortage of money?—Very frequently. We may require a large amount of money to spend on a sub-station, and I say I will spend it in a certain financial year. Perhaps the

money does not come forward, or the building is not completed within that year, and I dare not order the plant, because it is very heavy material and must be properly housed. Consequently I hold back my orders until there is a prospect of erecting it, and frequently a substantial delay is caused.

1757. Does not that mean waste?—It means that that service is not available then.

1758. Have you ever had to stop building when half-way through?—I should not like to say in regard to building. Mr. Cowdery builds for the tramways and Mr. Ranken the railways. We do not get the buildings when we expect them, but we are not responsible for that. I know what I want in the building, and give the plans, and they do the architectural work. I know that the buildings have not been completed to time in a number of cases.

1759. Can you give us a programme for five years ahead, showing what has been passed, so far as your department is concerned?—Yes, but take the railways. I have an idea what power will be required on the railways within the next five years. If the money does not come forward for our anticipated requirements the work will not be done.

1760. I am assuming that all this has been agreed to, and that Parliament has passed it?—They have passed electrification, but have not passed the money which will enable it to be done. This is a little outside my realm—but the Commissioners must get the money each year which they are going to spend in the following year, but if they do not get it they cannot give the officers the order to go ahead and incur expenditure.

1761. In the organisation of your department cannot you look further ahead than one year?—We do, to some extent, because occasionally we have to place orders that will not be executed in less than two years. I think the Commissioners in that case take the risk.

1762. Do you not find it extremely inconvenient to be held up?—In some cases it is, and we have on occasions been short of power.

1763. But you are quite unable to get out a programme for your own purposes to cover a longer period than one year?—We cannot do so with certainty—that is, in connection with new works. Of course, I get out my programme just on the assumption that I shall get it. I prepare my programme for more than a year, with the knowledge that if the money does not come the programme will not be followed out.

1764. Can you give us a programme for the next five years of works that have been passed?—It depends upon what you mean by that. The White Bay power-house has been built, and the Commissioners are completing the building, as you saw. At present we have two 22,000 kilowatt units on order and two 18,750. I have received approval for calling for tenders for another 22,000 kilowatt unit, and they have been called. Whether the Commissioner will have approval for that money or not when we get those tenders I do not know, but I have every expectation that they will. Then there is room for two more units after that to keep up this contract with the City Council, in regard to which a special Act was passed to enable us to enter into it. We will require the other units following almost annually. The policy has been approved by Parliament, and that agreement was authorised by a special Act. I have a programme laid out, showing that all those will be in service before 1930.

1765. If, for any reason, the electrification of the railways is held up, your power will not be required?—Not all of it, but a good deal will be wanted for the City Council. Within a few months it will be necessary to take the preliminary steps for the new power-house.

1766. Is the question of the City Council supply more important than the supply to the railways for electrification?—Oh, no; but I mean they are both required, and if the Government did not give us the money for the City Council it would be a very serious position indeed, because the whole city is depending on us now. They are not

building now, and if we had to run the city supply short for industrial and public purposes it would be a bad thing. It seems to me that there is an obligation. The position is a little unsatisfactory. The Lord Mayor saw the Chief Commissioner on this very point—what is their position if the Government will not give the Railway Commissioners the money to carry out this contract into which they have entered? Either must give five years' notice of termination of this agreement in this, so we are responsible for all that is involved in the necessary power-house provision so far as it concerns the City Council for the next five years at least. I drew out the 1937 diagram, showing what was wanted, and it showed an expenditure of something over six millions in that period. That means that the new power-house must be erected by 1930. As the site has to be selected and all arrangements made, it will be seen that it is certainly desirable that a start should be made next year with regard to the preliminary steps. We are asking for an undertaking to the Commissioners that would enable them to carry out their contract with the City Council. A qualified approval has been given that the Government will stand behind the Commissioners up to the completion of White Bay, which is a direct undertaking to supply that capital. Within twelve months the matter will have to be further considered, because the Commissioners will have to come within the five years period. If they did not get the undertaking from the Government it would mean that the Council would start a power-house of their own, which would be very regrettable.

1767. I take it that in all these things you have given the Commissioners an estimate of the cost and the date within which you will complete?—Yes.

1768. Sir VINCENT RAVEN: You have had a considerable section of research work, which appears to have been carried out very thoroughly. I understand you do some research work for Mr. Lucy?—Yes.

1769. Is this research work charged to general charges, or how do you apply the cost of this investigation?—I am afraid I should have to ask my accountant about that, but I assume he would charge them to the work with which they are connected, though, in some cases, it is difficult to do that.

1770. Have you any idea of the actual cost attached to that department?—No. It has been a rapidly growing one, and the man we have in charge has proved so useful, owing to his exceptional ability in a number of special investigations, that his work has grown very rapidly. His staff has been rapidly increasing, and is to-day probably 50 per cent. greater than twelve months ago. I think Mr. Lucy is now establishing somewhat similar conditions in Eveleigh. He has an investigator, though I do not know what class of work he takes. Possibly we may be doing less of his work in future.

1771. Of course, it is difficult to put into money value what you are getting out of a department of this kind?—Yes. Owing to the fact of his having been able to make a satisfactory pinion during the war we were saved from a very great difficulty. We could not get pinions from anywhere, and the one we are at present making is of a better class than we can buy.

1772. I quite realise the advantage of a research department of this kind, but I should like to have some idea of the actual cost?—Very well, I can get that.

1773. Outside your shops in connection with your tramway system you have a number of car sheds?—Yes.

1774. Can you tell me how the stock is dealt with there?—They are inspected every other day. They have a short run and a long run alternately. Inspection is thus possible in daylight. The effort in the car shops is to do nothing in the nature of workshop work, but to replace parts, and when anything more is required to send the car to Randwick. We have a very small skilled staff in the car sheds.

1775. Do you keep separate costs in connection with that?—Yes, the costs of the parts are kept separately.

1776. Are they drawn out of your stores?—The Controller has a store at each of the car sheds, which is entirely under him. We have a staff of about 600 connected with this car shed work.

1777. But they deal entirely with the running work, and any repairs which are required are sent in to the Randwick shops?—Yes, except ordinary replacements.

1778. I think I shall probably have to ask you for the cost of the car sheds and the staff outside?—The overall costs, or the costs per car mile.

1779. We can work out the costs per car mile if you will give us the overall costs, because none of your costs appear in the actual statement?—Very well; they are prepared every month.

1780. You deal with all the electric lighting and supply the energy and do the repairs, and I suppose you charge to that particular section the energy which they use at a certain figure?—Yes.

1781. Where are the lighting repairs done?—We have a special depot at the Central Railway Station for small repairs, and any serious work is done at Randwick.

1782. You buy the great bulk of your fittings outside on contract?—Yes. Where a specification is required we make one, but a good many things are standard articles in connection with this equipment. Radiators are standard articles. As regards service transformers, we make our specification out, which has to be complied with.

1783. I suppose you test most of these things, even the lamps?—We test the lamps for efficiency, and, of course, every transformer to see that it is all right, but we only test samples of the lamps. That is done very elaborately at Randwick for candle-power and efficiency. The lighting section is a considerable one, and it is entirely under me.

1784. Do you have the lighting of the carriages under you?—Yes, except that under the new arrangement the Chief Mechanical Engineer takes over all the rolling-stock, and I only act in a consulting capacity. He will have the lighting of the electrically-driven carriages.

1785. What about the steam stock?—That is all under me. The new electrical stock is under him, but he uses me as an electrical consultant.

1786. He consults you with regard to the train equipment and lighting and everything?—Yes.

1787. Are the cables, &c., under you?—Outside from the trolley wire to the power-house it is mine, and all the cables and mains are under me.

1788. And the pole erection with regard to the electrification?—As to those big steel masts, the mast erection is being carried out by the Engineer-in-Chief for Existing Lines, and I erect the cables and wires. We are making some of those poles in Randwick works. The cables are under me.

1789. And all the rail bonding?—The rail bonding is under the Signal Engineer, but I make the bonds. Then, of course, the rail bond has to meet my requirements. That is a case where both officers are concerned, because he has to have the transformers and the circuits and so on to complete his signal system. We have to work in conjunction. I have nothing to do with the electric signalling.

1790. Can you give us any reason why that is separate from the electrical department?—It was my proposal. When Mr. Johnson came out I pointed out to him that the interlocking was in the hands of the interlocking engineer, and all the electrical services in connection with the interlocking and the signalling were in my hands, and that it was frequently the case that repeaters and so on connected to his points and other apparatus wanted attending to. Two persons being responsible, it was quite possible that there would have been a disclaimer of responsibility under certain circumstances which would have caused trouble. It was not advisable to have two connected systems of interlocking and two different officers responsible. I pointed that out to Mr. Johnson, and shortly after that he decided to call for the Signal Engineer. It seemed to me that that was the only course

Witness—O. W. Brain, 24 July, 1924.

open unless I was prepared, and the Commissioners were prepared, to give me the points, which I certainly did not desire to undertake. When the Signalling Engineer came out, I transferred my senior officers, and very highly qualified officers, to him. They had specialised in that work, and since then that work has grown a great deal.

1791. Then he does not use you as a consultant in connection with it?—No, though he refers to me sometimes.

1792. Would he call himself a qualified electrical engineer, or does he rely on the staff which you transferred to him?—I would rather not say.

1793. I notice that in connection with the workshop you have stables for forty horses; for what do you use them?—For the tower waggons and tip-carts and pole removing, for taking the cables about and carting concrete and so on. A lot has to be taken by road in connection with the tramway service.

1794. But the railway service could be moved about on the rails?—Some of the material is advantageously taken about on the roads.

WITNESS: I should like to say that although Mr. Byles, as far as I know, had not done very much electrical work before he came here, he was a signalling expert, and I know that now he is quite conversant with his system and with the electrical circuits at the railway station. I know my officers have been useful to him. No doubt he has learned a great deal about the electrical work since he came here.

1795. Sir VINCENT RAVEN: Have you workshops in connection with the cable department?—Yes, at Leichhardt, though they are not elaborate. I like to make all those outlying shops as small as possible, and only carry out detailed work. I find the besetting sin of nearly all engineers is to get a workshop if they can, and it has been a battle to keep the workshops down. As soon as I find they are building up a shop to any extent I get the work transferred to Randwick. It is advantageous to have one or two blacksmiths there for doing special little jobs that turn up in connection with overhead line construction.

1796. You have anticipated my question, but you believe in concentration as opposed to decentralisation?—Most certainly.

1797. I see that you have a large mileage of cables to deal with. Are those bought outside on a specification through the Stores Department?—Yes, though at one time I dealt with them all direct. I issue the specification and deal with the tenders and acceptance and everything. The Comptroller's part in connection with the special technical things of that kind is mainly seeing that the contract is in order, and he passes payment for stocks.

1798. With regard to the telegraph section, Sir Sam Fay put a question to you and I see that you have a workshop?—Yes, at Redfern, employing about thirty-five hands.

1799. Is it contemplated that they should take your Randwick workshops in future to Chullora?—Oh, no; not the Randwick shops; it would be very inconvenient for the tramways. There is room for extension at Randwick.

1800. Then would not this little workshop be better there than detached somewhere else?—They do a great deal of incidental railway work which has been advantageous, but it might be worth considering transferring the bulk of their work to Randwick. That has been a special class of work which has grown up, and it works very well.

1801. You have another department here which appears to me to require a little explanation as to why it should be under you; the repairs and purchasing of clocks and watches, typewriting machines, and so on. I should have thought that the Stores Department would be the people who would deal with all that, and perfectly able to do it. You do not repair them, but simply get them done outside on contract?—Yes, we have a man who takes the contract, and we find that cheaper. At times the department has undertaken it, but we have gone back to the contract system. It wants somebody to look after it and check it. It is a troublesome little job, but there is not much in it.

1802. All those things are done outside?—They are done in a shop within a few yards of my office, and my chief clerk handles that work, and keeps stock of the clocks and watches, and sees that all the different departments are supplied promptly, and checks those cases where the watches and clocks are abused, and sees that the contractor gets a fair deal.

1803. I do not attach much importance to it, but it struck me as a peculiar addition to the electrical engineer's work?—There is no particular advantage to me in having it. Somebody else would have to undertake the work. The Comptroller is a little more distant, and perhaps it would be advantageous for the contractor to move his store, though I cannot see any reason why it could not be satisfactorily done by the Comptroller. In regard to typewriter repairs, it is an advantage to have a qualified mechanical engineer looking into the details and seeing that the Department is properly served in the matter of repairs. I think it is advantageous to have that work under an engineer.

1804. You deal with motor-cars?—Yes—unfortunately—and there are about eighty of them. They come into us when requiring repairs at Randwick. Some are sent outside. The unsatisfactory feature is that every now and then a car is bought and put into some man's hands, and he gives it very rough treatment in the bush—perhaps forgets to oil it altogether—sends it back for some trifling thing, and large repairs are required.

1805. Do you keep a number of spare parts for these cars?—I do not think so, but I think the works manager would send to the local depots. There was a proposal at one time that I should undertake the repair of all the Government cars, but I asked the Commissioners to decline it. I knew that a good car might be knocked about by an inexperienced driver, and when it came to the repair shop in six months it might cost, perhaps, about £200 to put it right.

1806. Do you keep those repairs separate?—Oh, yes! Each department is charged with repairs for its own cars, and that is where the trouble comes in.

1806A. WITNESS: In connection with one question that you asked me, I should like to mention that the figure I gave you showed the equation for the charge to the City Council. You said that you would like to know what would be the probable cost in connection with the railway service. That very complicated definition in the agreement is really embodied in that equation, .29 of the root of  $\frac{1.00}{.35} \times \frac{11}{12}$ . That  $\frac{1.00}{.35}$  is merely the reciprocal of the load factor, and  $\frac{11}{12}$  is an assumption. For instance, if we have 44,000 kwts. of plant in service and 48,000 kwts. of guaranteed load, the relation of the plant in service to the guaranteed load would be  $\frac{11}{12}$ . It takes about twenty lines in the agreement to set out, but this is all it amounts to. It is the reciprocal of the load factor of the individual consumer multiplied by the reciprocal of the load factor of the effective plant. There is a capital charge of £3.25 per kw., and that at 35 per cent. load factor works out at .255d. The running cost equation gives .47d., making the total cost .725d. Deducting a profit of 10 per cent., it leaves the actual cost to the Commissioners upon this basis, which is the result of very careful computation, at .653d. at the power-house. Your question was in regard to the cost at the sub-station. Our line figures, worked out on Kelvin's law, average a loss 3 per cent. for the latter, makes 6 per cent. increase, and the actual value of that should be just equalled by the capital charges on the cable, and if we charge another 3 per cent. for the latter makes 6 per cent. increase, and the cost, therefore, at the sub-station to the Commissioners under these circumstances should be .692 per kilowatt hour. I have taken the 71,000 kilowatts at 35 per cent. load factor, which equals 21,800,000 kilowatt hours which, at .692d., equals £627,000. That is taken on 72 watt. hours per ton mile, which is the result of many months of work. I have worked in conjunction with the Chief Mechanical,

Engineer's officers in obtaining that ton-mile result. This is assuming 500 pairs of cars. It is shown on the statement.

1806b. Is 35 per cent. as a load factor a fair thing, because, of course, it is an estimate which does not exist?—I admit that Mr. Hodgson's estimate is lower. If we take the hours he gives it would be lower than thirty-five. The load factor in Melbourne is over 50 per cent., but that includes a great deal of industrial load as well, but it must be certainly a long way above thirty-five. The load factor for the whole of the British electric railways in 1918 was 37 per cent. Mr. Bradfield carried out very elaborate calculations over the system, and he arrived at 36 per cent., so I think 35 per cent. is fair, and it accords with a number of systems. I think that is the figure you really asked me about.

WILLIAM HUTCHINSON, Chief Engineer for Railway and Tramway Construction, sworn, examined as under:—

1807. Sir SAM FAY: You are responsible for the construction of all new lines for the New South Wales Government, under the Commissioners?—Yes, with the exception of the city railway, for which a separate branch has been created. I have nothing to do with that.

1808. Formerly you were the engineer for the Public Works Department?—Prior to 1st January, 1917, the Railway Construction Branch, since its inception in 1855, was under the Public Works, not under the Railways, and I was there as an officer and chief of that branch before I came to the Railways.

1809. Then in 1918 you were transferred to the Railway Commissioners?—On 1st January, 1917.

1810. Do you make surveys for new lines?—The surveys are all made by Mr. Kennedy, who is the Railway Engineer for Surveys.

1811. Is he under you?—No. He was up to a certain time, then afterwards he had a separate branch created.

1812. So that as far as you are concerned you have to take over the construction of a new railway, the survey for which you are not responsible for?—No. I have certain rights. If I want deviations made, or if I think alterations should be made I have the right to get that done.

1813. You make the suggestion to whom?—Now I should make it to the Secretary for Railways.

1814. If you were not satisfied with the location of the lay-out?—Yes. For instance, in constructing some of our lines we often see necessary deviations. I make them then without consulting anybody.

1815. Having the layout before you, you proceed to get the plant on the ground?—Yes.

1816. That plant is your property, so to speak?—Yes, it belongs to the Railway Construction Branch.

1817. What is that plant capable of doing;—is it capable of constructing completely a line of 100 miles in length?—Yes, with the exception of the locomotives, and probably some trucks. Under the present arrangement we hire those from the Chief Mechanical Engineer. When we were with the Works Department we had our own locomotives. I think we had about eighteen locomotives when we came over to the railways. They were then absorbed in the Chief Mechanical Engineer's Branch, and I have to hire those when I want them.

1818. The Chief Mechanical Engineer took over from the Public Works the engines which you formerly had?—Yes.

1819. And when you want engines for construction you go to him for the loan of them?—For the hire of them.

1820. And a charge is made against the construction of that branch?—Yes.

1821. Then with regard to material—rails, sleepers, fastenings, girders, and so on—do you buy?—If I want any material I make a recommendation to the Railway Commissioners. They will approve of it or reject it as

they think fit. If they approve, I get out the tenders and the specifications and the drawings, and tenders may or may not be invited. Generally, if it is a large thing tenders are invited. Those tenders would come on to me for recommendation. I make a recommendation, and the Railway Commissioners exercise their right as to whether they approve or disapprove. That is the *modus operandi*.

1822. That is to say, public tenders are invited for the material you want?—For anything that is of a large amount. For small amounts we will get quotations, probably from a number of firms.

1823. Does not the Chief Engineer for Existing Lines supply you with a good deal?—Take the case of bridges. He is making at the present time, and has been for some time past, most of our steel bridges. We are not getting those made outside the Railway Commissioners' shops. I supply a list of the necessary material. The Comptroller of Stores sets about and gets that material. The dog spikes and fishbolts for the lines are made, the dog spikes chiefly by the Existing Lines Branch, and the fishbolts by the Chief Mechanical Engineer's Branch, on requisition of those branches.

1824. Do you buy the sleepers?—We have bought those for many years past direct from the cutters. Just at present I requisition for them and get them from the Existing Lines Branch.

1825. The same thing with regard to rails?—No; I have my own contracts for rails.

1826. You make your own contracts for rails direct?—Yes; of course, with the approval of the Commissioners.

1827. When you commence to build a new line, do you give the Commissioners an estimate of the cost, and the date on which you can complete?—No; I could not do that. I give them an estimate of the cost. That is laid down in the Act. Any expenditure over £20,000 has to be approved by Parliament. An Act has to be passed for that, and in that Act the amount of money proposed for the line is stated. That, of course, is known by the Commissioners. Beyond that I do not give them another estimate.

1828. But the original estimate is yours?—Yes.

1829. Do you give a date for completion?—No.

1830. Why?—Because you never know what money you are going to get or how long it will take you to complete.

1831. Then when you start a railway, whatever the length may be, you are not in a position to say when you can complete that work?—No. I would be in a position to say when I could complete it, if all the money that I wanted was provided, but it never is.

1832. So that it means that you start on the railway, the estimated cost of which is so much, based on continuous work?—Yes.

1833. But in consequence of the budget being a yearly one, and your not knowing whether you are going to get the money or not, you are unable to give a date for completion of the work?—Quite so.

1834. When you start a new railway you appoint a resident engineer?—Yes.

1835. You have, I suppose, a number of men at your call?—Yes.

1836. Permanently employed?—Yes.

1837. You have given us not only a number of estimates, but the actual cost of certain of the works which you have carried out?—I selected two as an illustration—a light and a heavy line.

1838. What struck us rather was that the surveys of these lines seem to cost a very considerable sum compared with the total cost of the railway. Is there any particular reason for that?—Take your Glenreagh to Dorrigo line. Your surveys and so on cost £22,000. It seems a lot of money?—I can explain that. This particular line is one of the most difficult lines I think we have ever built in New South Wales, and there has been a tremendous amount of survey work. For instance, the trial surveys are up the face of a range from Glenreagh on the North Coast, and it is an extremely difficult survey. When the

Witness—W. Hutchinson, 24 July, 1924.

surveys were made they were through a dense forest that you had to cut your way through. This is not an ordinary survey; it is an extraordinary survey, and although that amount there seems very high, it should be borne in mind that there was a tremendous amount of exploration work and difficulties in making that survey.

1839. They could not get their levels by observation?—No. It was a most difficult job in every way. Then the country is so rough that a very great deal of detail work had to be done before you could locate a line at all.

1840. Did they follow a river course or anything of that sort?—No. The line rises for the first 12 miles right up the side of a range. It rises about 1,800 feet, then it is crossing and recrossing quite a number of waterways at right angles nearly. Another thing is the rainfall is extremely heavy, and there is a tremendous amount of delay not only in survey work but in construction work. That would be an instance of the very heaviest expenditure in connection with the survey of any line I know.

1841. That is an explanation of the rather extraordinary cost of survey, that they could not take their sight levels?—That is so.

1842. Do you know how long it took them to take those levels?—There were a great number of parties at different times; different lines with different curves were surveyed. For instance, the first time this was surveyed the curvature was 5 chains. The estimate for the 5-chain line was very much less than the estimate for the line of 8 chains. We were then under the Works Department. The Railway Commissioners then said, "We want that line changed to 8 chains to take our rolling-stock and certain of our engines," and the change was made. That meant a fresh survey practically of the whole line.

1843. What expenditure in your particular branch is there authorised within the next four or five years?—That is never known. I do not know to-day what amount of money I am going to get for this financial year, which we have just commenced from the 1st of this month. It is impossible for anyone under the method of voting money to-day to lay down a fixed plan and arrange an organisation extending over, say, a period of two or three or four years. It is quite impossible, because Governments change. Incoming Governments have different views about lines from other Governments, and the amount of money they vote depends just upon the will of Parliament.

1844. When it is decided that a new line shall be made in the country, is not a vote taken for your estimate of cost?—No; an Act is passed, but it does not follow at all that the line will be proceeded with at once—they might not even construct the line that is authorised by Act of Parliament. There are lines which have been authorised by Act of Parliament years ago which are not built to-day. Nor do they, when they put an Act of Parliament through, at that time raise the money for building the line. The process which is followed is: after the Act is passed the Minister will say to the Railway Commissioners, "We are going to place a certain sum of money this year on the Estimates, and we wish you to have that line started." That is the way the line is started, and only the particular amount of money is voted for that year.

1845. Apparently there is a committal by the Government more or less for the expenditure over the next few years of two or three million pounds at least?—To-day there are six lines for which there are Acts of Parliament. Presumably those lines will be built, but no instructions have yet been given to the Commissioners to build any of them. They run into a good deal of money. There are three tramways authorised; probably they would be under £100,000, but the railways will amount to a good deal.

1846. Upon which a good deal of money has been spent in survey?—Yes.

1847. Then what does it mean to you under the existing organisation; does it mean that when you have a railway half constructed you are suddenly told there is no

more money available?—We have lines that we are finishing now that were closed down owing to the fact that there was no money to construct them. That, I think, was largely due to the conditions prevailing in war time. That would be rather abnormal, of course. But what does happen is—say I had a railway 50 miles to build at a cost of £300,000 or £400,000, I might be ordered to commence the construction of that, and on the vote £50,000 might be put down for the first year. That means that you cannot carry out your work in the most expeditious way or the most economical way, and that is one of the difficulties, I always contend, in carrying out the work by day labour, which is our principle to-day. If the line is let to a contractor the Government has to provide the whole of the money, otherwise the contractor would bring enormous claims if he was blocked, and quite rightly so.

1848. We have looked through some of the minutes which you have made from time to time at your monthly conferences, and of course we could not help but be struck by some of the remarks which you have made. According to these minutes, you have said from time to time that you could not economically carry out the work?—That is quite correct.

1849. And that you could have finished the lines very much earlier?—Yes.

1850. And have earned money by the railway, which was not possible because you were stopped for the want of money?—Yes.

1851. Does it mean that when you were stopped in that way you get rid of your staff?—No. If you have a line going on, and you are, so to speak, dribbling through the work, your organisation practically has to be the same, because you have to take the time and you have to look after the men, and you have to do everything. You might perhaps have a clerk or two less, but that is all. You have to have the engineers there, and you have to have your organisation. You will not have the number of labourers; of course, you only keep the number of labourers on that you can afford to keep on—that you pay for doing the work.

1852. As far as your administrative staff is concerned, you have to keep them going; your overheads are the same?—Practically the same. You would not have quite such a large staff, but you would have pretty well near it.

1852½. With regard to your actual operating staff, those men would be got rid of—I mean your navvies?—Yes. I have two lines going on to-day. I got £50,000 last year for one of them and £83,000 for the other. I asked for a great deal more than that. During the last year I have limited the expenditure each month, so as to keep within that at the close of the financial year just ended. That was not an economical way of doing it at all. If the Commissioners had been able to get it from the Government, and had said to me, "You go ahead as fast as you can; we will supply the funds," the lines would have been nearly finished, and economy would have been created in every way.

1853. So that it amounts to this: that the whole of your plant for the construction of your railway is lying dead because you cannot construct continuously?—A good deal of it. As regards those two lines I mentioned, of course I did not send the plant on to the job, because I knew the conditions when I was starting.

1853a. In your view, would it not be more economical to wait until there was a certainty of getting the money and going straight ahead with the work?—My view is that it would pay the Government, if they are short of money, to say, "We shall only begin the number of lines that we can finish, and that our money is capable of letting them go ahead at the fastest rate at which they can economically be done."

1854. This is a minute which you made on the 28th April of this year in regard to the Glenreagh-Dorrig railway: "The chairman said he had asked for information as to whether the difference between the amount expended on the line at the end of February and the estimate will be

sufficient to complete the work, and the Chief Engineer for Railway and Tramway Construction said that the difference would not be sufficient to complete the work. He pointed out, however, that there was about £50,000 worth of plant on the line, a good deal of which, unfortunately, he would not be able to realise on, as there was no line to which it could be transferred, and the amount involved would be debited against the line." Does that mean that if you have £50,000 worth of plant left over after the completion of a railway, and you have no new line to which that can be sent, that £50,000 is debited to the cost of that particular railway?—Yes. On railway construction there is no plant account. All plant purchased for construction is debited in the first instance to the vote for the line to which it is sent. Take this Dorriggo line, where I say there is £50,000 worth of plant. If that plant could be sent direct on to another railway, that railway would be debited with the cost, and the Glenreagh-Dorriggo railway would be credited. On the other hand, if there was a plant account the plant account would be debited to the cost and the Glenreagh-Dorriggo credited, but neither of those things can be done, consequently the plant remains a debit to any line on which it happens to be until it is transferred to some other line.

1855. Is there not any method of writing off the cost of the plant in proportion to its wear and tear, and so on?—In the Works Department we had a certain depreciation. When we came to the railways the Railway Department had a different method. Instructions were issued that all plant was to be kept in first-class order, and that the cost of doing that was to be a debit against the line on which the plant was at the time, but that no further depreciation was to be written off. Later than that, I think, although it has not been done yet, some depreciation will be made of the plant—more than has been done in the past.

1856. Is there any set basis upon which depreciation is made?—We have a set basis in the Works Department. Certain plant was depreciated 5 per cent.; that was plant which would last quite a long time. Then there was other plant depreciated 10 per cent. and 15 per cent., and plant that readily wore out 25 per cent.—in four years we wiped it right out.

1857. Have you any idea of the value of the plant you have in your branch?—When we came over from the Works Department we had about £260,000 worth of plant. Of course a lot of that has since been scrapped as worn out, useless. We have purchased new plant at various times, and I should say the depreciated value of our plant to-day would be about £160,000.

1858. In that £260,000 that you transferred from the Works Department to the Railway Commissioners were the engines included?—Yes.

1859. And the debit for the engines was taken over by the Chief Mechanical Engineer?—The Chief Mechanical Engineer took them over and the Works got credit.

1860. So that to that extent your £260,000 would have been reduced?—Yes.

1861. And now you estimate you have about £160,000 worth of material available for construction work?—That is the depreciated value of it.

1862. Depreciated value debited to each particular railway constructed?—The whole of the debit has not yet been made.

1863. So that you have a vote for a railway of so much, and you have not charged against that vote the whole of your depreciation?—No.

1864. Sir VINCENT RAVEN: Are the surveys of the lines which you are going to make submitted to the Chief Commissioner for his approval before they are started?—No.

1865. Does he approve of the curves and gradients?—Yes, he would be consulted about that.

1866. It would be submitted to him, and he would approve of the gradients and curves which exist in the survey?—Yes.

1867. I judge from what you say that practically all your estimates eventually are very much exceeded?—That naturally arises because the rate of wage is always changing.

1868. I mean, from the point of view of being stopped?—I would not like to say at the moment that they are all stopped, but very few of them are proceeded with at the speed at which they could be most economically carried out.

1869. That means that your estimates are very much exceeded eventually?—Yes, but I want to make it clear that the one great cause for the exceeding of estimates is the variation of the rates of wages. For instance, the Commissioners do not control the wages at all; the Court does that, and the rate of wages is a most difficult problem. It is almost yearly changing. I have here a sheet showing the variation in wages since 1904. (*Sheet handed in.*) There are three copies there, and there is a little plan. There is an extra climatic allowance always made. That shows the variation from 1904. That is for the navy. I may say that the skilled labour is always increased in practically the same proportion, perhaps a little more.

1870. It has rather decreased since 1922?—There is a slight decrease there.

1871. In 1921 it appears to have got to its maximum?—Yes, 17s. 3d., I think then.

1872. And it goes down to 15s. 2d.?—Yes.

1873. You said with regard to the plant which was left over from a line which had been completed, and there was not another line to which this plant could be usefully moved, the line which had just been completed was debited with the cost of that plant?—Yes.

1874. I presume, when it is moved on to another line then that portion of the line gets credit?—A vote immediately goes through credited to the line from which the plant has come, and the other line debited. Finally it adjusts itself. It sometimes takes some years to do it.

1875. Sir SAM FAY: Arising out of the last answer, do you know out of what monies this plant was provided?—Yes, it is out of the loan money for the line.

1876. I am talking about the original. You came over from the Public Works Department with £260,000 worth?—That was always the same. It was always debited to the loan votes.

1877. Supposing you started with £260,000 worth of railway plant for construction at the initiation of your particular department that would be debited to the particular lines then proposed to be constructed?—Yes.

1878. It is passed on from one to the other?—As long as the plant lasts it is passed on from one line to the other, and the line is debited and credited, and so on until it is scrapped. The last line has to bear the total cost of that plant at its then value.

1879. That is all we have to ask you, unless you would like to say anything yourself?—I would like to say in railway construction one of the essential factors is keeping the cost and knowing the correct value. In our method of accounting we have a system of double-entry on the unit basis. Whether we do our work efficiently or not—I think we do, but it may be said we do not—we know the actual cost of every unit item of our job, and there is no escape from being debited with every cost on the line. I have been looking up journals and all that, and I had a trip abroad on one occasion, and I have not seen a system which I considered gave a better result than the system of costing which we have. Of course, it is said that the day-labour system is a very costly system, although some people prefer it, but I contend we know exactly our costs, and there is nothing done by guesswork. Some things we make mistakes over; some things we do well.

1880. Your day labour is dependent upon supervision?—Yes. Up to 1897 we had all contracts, but since then we have had all day labour. I have been in my present position over twenty years now, and with the exception of three or four jobs it has all been day labour.

Witnesses—W. Hutchinson and Dr. J. J. C. Bradfield, 24 July 1924.

1881. You apparently rather anticipate some criticism of the day labour system as far as your department is concerned?—We get it, too. I do not say that sometimes it is not deserved; probably it is. We cannot expect always to do a thing in the best way, but I think generally we do. We have very close supervision. It depends, of course, so much on the Government in power. Some Governments want contract, some want day labour.

(Witness retired.)

Dr. J. J. C. BRADFIELD, Chief Engineer, Metropolitan Railway Construction and North Sydney Bridge, sworn, examined, as under:—

1882. Sir SAM FAY: You are the Chief Engineer for Metropolitan Railway Construction and the North Sydney Bridge?—Yes.

1883. Have you made any progress plan of the construction of the city railway?—Showing the work from month to month?

1884. Showing when you are going to finish?—That depends upon when the money is made available.

1885. Did you make the estimate for the railway?—Yes, originally.

1886. When you made the estimate did you not anticipate a date?—We anticipated being able to finish the work in five years.

1887. That is to say, your estimate was based on the time it would take you to finish the construction on an economical basis?—Yes.

1888. I presume that your estimate was more or less an economical one based on time?—Yes.

1889. I gather from you that you do not anticipate finishing to time?—No. We have not the money available to start on the western side of the city. The money so far available is to go on to St. James and open up to there.

1890. Have you up till now been held up for money?—To this extent: I ask for a certain amount of money. This year I asked for £900,000. I am going to London on Wednesday. I do not know how much has been made available, and probably the office will not know for another two months. Probably the amount asked for will be cut down to about half; and of course you cannot prepare any scheme of work until you know what money is available.

1891. You started your financial year at the beginning of this month, and you will not know until the end of October or November how much money you can spend in the financial year?—That is from 1st July to 30th June.

1892. How can you construct economically under such a system as that?—Of course, candidly we cannot. We do the best we can. We do not overload the staff in any shape or form; but I cannot expand the staff if we get more money available than we think will be made available until it is made available.

1893. It is quite possible that your date of five years may be seven?—It may be ten or twelve by the way it is going, with an estimated cost of £4,500,000, and an expenditure of £360,000 a year.

1894. The first section is really the important one for the purpose of relieving the Central Sydney Station—the completion to St. James?—We are going to complete to St. James'. The most important section to complete is to Wynyard-square. The bridge contract is a six-years' contract, and the city railway should be completed to Wynyard-square on or before that date.

1895. Sir SAM FAY: Wynyard-square, you say?—Yes.

1896. That is three-parts of the way round the circle?—Yes. The railway from the bridge will join the city railway at Wynyard-square. The bridge contract is to be completed within six years. So we must soon start on the western side of the city, because it is difficult work on that side.

1897. You are constructing now from the Central Station down to St. James?—Yes.

1898. But you have done nothing on the western side?—Nothing from Goulburn-street towards the western side of the city. We are constructing the whole of the work from Redfern to Goulburn-street, and from Goulburn-street, on the eastern side of the city, we are completing the work to St. James' Station. We have not made a start on the western side of the city, which is by far the more difficult work.

1899. You say it is essential in order to use the bridge for electrical railway traffic, that you should complete to Wynyard-square at the time of the completion of the contract for the new bridge?—Yes, else we will have to terminate the traffic from North Sydney at Wynyard-square Station.

1900. Is it not essential to complete the whole lot at the same time?—It would be far preferable. We could leave a piece out at the Quay, but it would be far preferable to complete the loop, so as to prevent shunting at St. James' and Wynyard-square. The contract has been signed with Dorman, Long, & Company for the building of the bridge within six years. The contract will really date from the signing of the plans in England, which will be about November next. So I anticipate, everything going right, that the bridge will be open for traffic on 1st January, 1931.

1901. Roughly, six years?—Just a shade over six years.

1902. What is the estimate for the work?—The estimate for the whole of the city railway is £4,500,000.

1903. Four and half millions for the city railway apart from the bridge?—Yes. The main bridge will cost £4,217,721, and the approaches will cost one and a quarter millions.

1904. The amount included in the Act for the approaches and the bridge, £5,500,000; does that figure include the work at the Central Station and the land?—The £4,500,000 is the cost of the city railway construction only, and does not include cost of land resumption.

1905. What is the actual cost to the State, all in, of making the city railway, including the work at the Central Station?—We have practically resumed the whole of the land now. The city and suburban railway resumptions have cost to date £896,000. We have resumed the land we want in the city.

1906. That might cost £1,000,000?—No, we have resumed all the land we will want.

1907. That is the value of all the land you will want from the Central Station to complete this circuit of the city railway?—Yes, unless we find some of the buildings to be of such a character that it will be necessary to resume them for safety, or pay compensation.

1908. Then to your estimate of construction, roughly, million has to be added?—Yes.

1909. That is £5,500,000 for the whole think, lock, stock, and barrel?—Yes.

1910. And that includes the work at the Central Station?—Yes.

1911. You are going on with this work on the eastern side. If you are held up when you get fairly well to work, would it not mean that you will not be working economically, that you will be getting rid of your men and all that sort of thing, and that your plant will be lying idle?—Yes.

1912. All that being due to the fact that you are depending on a yearly budget?—Yes.

1913. Sir VINCENT RAVEN: Are you responsible for the electrical side of the work?—No. I am constructing the permanent-way and stations. Mr. Brain is responsible for the electrical side. We have a committee, and discuss all the questions together.

1914. That work is not in your estimate of £5,500,000?—There was an amount included for the overhead equipment and signalling, £185,000 in all.

1915. Sir SAM FAY: For overhead wiring?—Yes, and signalling.

## TWELFTH DAY.

WEDNESDAY, 30 JULY, 1924.

(Held at Chief Secretary's Building, Macquarie-street, Sydney.)

## COMMISSIONERS :

Sir SAM FAY.

Sir VINCENT L. RAVEN.

Sir MARK SHELDON, President, Sydney Chamber of Commerce, sworn and examined, as under :—

1916. Sir SAM FAY: I understand that the Chamber of Commerce, Sydney, of which you are President, is representative more particularly of the industrial side of business in New South Wales?—Not so much the industrial side. I should say the Manufacturers and the Employers' Federation are more representative of the industrial side. We are on the commercial and distributing side.

1917. You do not represent the pastoral and the agricultural interests?—No, but the pastoral and agricultural people are affiliated with us in certain ways. For instance, they have representation on the council, but they express their own views.

1918. And there are certain other Chambers of Commerce affiliated with yours?—Yes, practically all the Chambers of Commerce in the State. You have a list of them there. I think there are thirty-five bodies, or something like that. The only exceptions are one or two who just within the last few months, on account of the new State movement, have started something of their own in the north, but the principal bodies even there are members of the Sydney Chamber of Commerce.

1919. We may take it then that your Chamber represents the commercial side of New South Wales?—Yes, if anyone does.

1920. You have sent us a certain number of suggestions on which you are prepared to give evidence, and you have tabulated them under seven heads. Perhaps we might take them in the order in which you have sent them in. First, with regard to the financial control of the railways in 1 (a). Will you be kind enough to elaborate that item?—It is our opinion that the money invested in the railways at the present moment—of course, you understand that the money invested in our railways is all borrowed capital, and a certain amount of the State debt, a very large proportion of which has been incurred and expended on behalf of the railways—we think that that money should be earmarked, and that the Railway Department or the Railway Commissioners should have a separate debt, or a certain portion of the debt, assigned to them. Any future expenditure in the way of a capital nature which it was required to make to bring in more money for the railways should be treated in the same manner, and there should be railway bonds issued similar to what is done in the neighbouring State of Victoria in regard to the metropolitan Board of Works. You know what is the practice there; I need not elaborate on it. It is a bond issued with the authority of the Government, and carrying the State Government's guarantee. This would lead, in the first place, to everyone knowing exactly what money there was in the railways, what was the capital invested, and it would also, we think, serve as a means of putting a check on people desirous of having railways which would be, after all, in some cases a little before their time.

1921. The proposal as you have it here, and as I take it, is that, roughly, £100,000,000 of loan moneys should be issued by the State for railway purposes, not specifically, but should be demanded from the consolidated fund of the State and transferred to the railway administration, and

upon it, subject to State guarantee?—Certainly, I go so far as to say that in that case, if you do not do it, at the present moment the railways may be called upon to bear the interest on a debt incurred for other purposes, till you have got a regular hotchpotch, and it is hardly fair to the railways, and, again, it is not fair to the public. You are mixing up your direct taxation with your enterprise taxation.

1922. We have had some evidence of it already in regard to what you are saying, and undoubtedly there are difficulties, but you do not mean that it would be necessary to re-issue the £100,000,000 as railway stock?—Of course, as the lines matured I would do it, but not now. That would be only complicating matters.

1923. You suggest that it should simply be transferred into the books of the railway administration?—Yes, and as present loans matured I would then issue the railway bonds to renew them. Of course, always guaranteed by the State.

1924. When you come to new issues for the general purposes of the railways, do you think it would be necessary to have a State guarantee, provided the issue was a first charge upon the railways?—I do, in this way: that you would get it at a lower rate if you had the State guarantee.

1925. I was rather looking at it from this point of view: You have already got, roughly, £100,000,000 guaranteed by the State. If you put on top of that another £20,000,000 as a first charge, you have got a State guarantee. I am looking at it rather from the point of view of the investor?—I see your view, but all the same I am talking now of the State of New South Wales and its resources, and I still think that the guarantee of the State would attract investors all the time. Of course, your question to me no doubt has a bearing on the practice in other parts of the world; for instance, bonds issued in connection with the United States railways. I do not think that is practicable in this country. I mean, frankly, it is not practicable politically, where, for instance, you would have an engine with a plate on it to the effect that "This engine belongs to the bond-holders, and in case of default," and so on. I do not think that would appeal to the sentiment of the people here.

1926. I was looking at it from the point of view of the investor, from whom you have to attract capital?—The investor, too. The investor here will, after all, look with favour on a State guarantee.

1927. He will, but there is a certain class of investor to whom railway bonds and shares are more attractive even than State bonds?—I do not think you would find them in this country.

1928. But you have to go outside to get a good deal of your money?—Certainly, but there are very exceptional cases with regard to some railways, probably such a railway as the C.P.R., but I have seen the dealings of the C.P.R. and the provinces in New York, and I think the provinces on their own dealings have got a shade the better of it.

1929. You see what it amounts to is this: The State wants money now, and the State will want money every year. If the Railway Commissioners are going side

Witness—Sir M. Sheldon, 30 July, 1921.

by side with them into the money market, you are going to get a certain amount of competition?—I do not propose that the Railway Commissioners should issue bonds whenever they liked. It must be subject to the Government of the day, if the Government are going to guarantee it. My proposal is that the Government should guarantee it, and before the bonds can be issued they must be issued at the time and at the convenience of the Government of the State.

1930. Then you are not getting rid of political control?—Certainly, you have got control in that way, but it would probably be a more desirable form of control. As far as I am personally concerned, I would quite advocate the railways being sold, but I do not think that is possible in this country. I do not think it is possible politically, but I think the economic effect would be very much to the advantage of the railways.

1931. You see, we have had abundant evidence of the waste which has gone on for very many years here in consequence of financial stress, the holding up of works half constructed, railways half constructed, works which ought to have been carried to a conclusion rapidly and economically. We have had abundant evidence of that waste, and as far as I can see the only method of getting rid of it is to put the finances right?—Do you mean to say by that, what would be my suggestion to overcome that difficulty?

1932. Yes, we would be glad to hear it?—The Railway Commissioners, or whoever has control of the railways, want money. They are going to carry out certain works. They do not want it all at once. They get authority from the Government, or the Government of the day, say, to issue £10,000,000 worth of bonds. They do not issue them all at once, but once they have got that authority they can use the money as they require it and issue the bonds then, in the same way as is done in Victoria in connection with the Board of Works, when they issue bonds for what money is required. When they get the money they have control, and they know exactly what is wanted. As the work proceeds they can go on raising the money.

1933. Of course, that would do away with the present practice of being absolutely dependent upon the yearly budget of the State?—Yes. I think with you—as you must think—it is a shocking state of affairs. Take, for instance, the city railway. You have only got to go out of this building to-day and walk up the street and have a look at this city railway being built. Just think of the interest which is being lost on all the moneys laid out there. I do not think any other country in the world would stand it, and the working-man knows, as he lives here, that all that is only done as a political expedient. The work is not carried out on business lines. The Railway Commissioners are not responsible for it; they cannot help it. It is political control, but the idea I have got, or what I suggest, would, I think, obviate that waste, and still satisfy the public sentiment of this country where it is desired to keep the railways under the control of the State.

1934. What occurs to us is that so long as a business concern like this, which is a great commercial enterprise, probably the biggest thing in the Commonwealth of Australia, is dependent upon a yearly budget, which is not passed until months after the commencement of the year, it means that the Railway Commissioners do not know how much money they can spend during that year, and you will have this continual waste going on from year to year, and it not only means waste to-day, but the interest which has to be paid on that waste; and your suggestion is that you should eliminate the yearly budget as far as the railways are concerned—take it clean out of the consolidated fund, and having once got Government's sanction for the commencement of a work, the Government should give the Commissioners power to issue warrants?—Quite so.

1935. Of course, in putting these questions to you, you must please assume that I neither agree or disagree with

what you say. Of course, we have not come to any conclusion yet?—Quite so.

1936. Coming on to your 1 (b), you say that the Railway Commissioners should publish a balance-sheet in the ordinary way. I assume there you mean that they should publish a balance-sheet, showing the capital account, revenue account, and the net revenue account?—Yes.

1937. With the necessary departmental statements showing depreciation, renewals, and so forth?—That is so.

1938. You know that there is no reserve in the accounts of the railways here?—Unfortunately, I do know it.

1939. You would, I assume, in the public accounts of the Commissioners, have included estimates of future expenditure?—Undoubtedly.

1940. And those accounts should be presented to your legislative chamber once a year?—Yes, and I would go so far as to say this: that the railways should show their workings from month to month; that is, the revenue and their earnings—I do not mean to go into a detailed account—but they should adopt just the same practice as you have in England and in America—just the earnings of the railway to show what is going on from month to month.

1941. And that is an estimate which is often very near the mark?—Yes, to within 2½ to 5 per cent. usually.

1942. In 1 (c) you say that the Railway Commissioners should provide for depreciation and replacement?—Yes.

1943. In the year ended 23rd June last, the Railway Commissioners showed a profit sufficient to pay over 5 per cent. on the moneys invested in the railways?—That is so.

1944. That was rather a notable achievement?—It certainly was.

1945. Do you know of any other country in the world where the railways, as a whole, State and private, have paid 5 per cent. during the past ten years?—They certainly have not done so in America.

1946. But when you come down to the accounts, and you find that no provision is made for wasting assets, in the shape of old engines, rolling-stock generally, the roads, machinery, and so on, that does not quite show the position?—It does not. When you take an arbitrary figure such as that there is £100,000,000 invested in the railways, and we know well that the life of most of the things on the road vary, such as rolling-stock and the road itself, and there is no disclosed depreciation of that kind, it simply means, as far as I can see, that they have worked on a working account, and no depreciation has been provided for, and therefore that 5 per cent. is materially out.

1947. Of course there has been a very remarkable development during the last ten years. According to the evidence we have had before us, the railways have increased 35 per cent. in mileage and nearly the same in capital. They are, roughly, a third more in mileage and in capital in ten years?—Yes.

1948. As to 1 (d), there your suggestion is that there should be five commissioners?—Not particularly five, but I think five would be the best number, the chairman to be one of them.

1949. You suggest that one man should be a construction or maintenance man. Would you not rather think that it would conflict with the responsibilities and duties of the Chief Engineer. If he had a survey expert or an expert in fact as a commissioner?—The suggestion put forward is one put forward with a certain amount of knowledge. I know the objection to having experts on boards. In ninety-nine cases out of a hundred they are dangerous.

1950. Some boards have suffered from them?—Yes. I myself personally have seen one or two staffs which have suffered from experts being on the board.

1951. With regard to three and four you suggest a business man and also a man of financial knowledge. Would not those two go together?—I suppose you can easily get them together, and if you can get those qualifications combined, so much the better. Certain business men, though, have not got what you call a financial knowledge, whereas

on the other hand the financial man has not got what is ordinarily termed a business knowledge, and he looks to one side of the question only; but if you could get those qualifications combined, of course such a man would be ideal.

1952. You suggest with regard to five that he should be experienced in the handling of men. Is it not your experience in business that the views and acts of the man at the top go from top to bottom, and do you not think that labour questions might be left in the hands of the head of the commission, who would instruct the chief officers?—In regard to the question where we have put forth the proposition that there should be five Commissioners, we have always put it forward with the proviso, or with the idea, that there should be a chairman, as there is a Chief Commissioner now, and the other Commissioners were to be channels, and they would take that side of the business much as the executives or the vice-presidents of railways do on the other side of the world. There you have the president and vice-presidents, and the vice-presidents, as a rule, are men who are actually engaged in the business, and they are executive officers.

1953. What you are referring to is such an organisation as the Canadian-Pacific?—Yes, where you have such a man as Mr. Beattie, a young lawyer and a famous man, as president.

1954. But he selects his vice-chairman?—He does, with the consent of his board.

1955. But in effect he does?—Yes.

1956. Who do you suggest should appoint these Commissioners?—I know who I would like to suggest, but after all I suppose the people own the railways. The people are the shareholders in the country, and in a democratic country like this I think the people should appoint them.

1957. That is to say, the Government of the day should appoint them?—Yes, but they should allow certain interests to nominate one man, or something like that. But, after all, the people represent the shareholders in the concern, and the Government should have the final say at any rate. I cannot get away from that.

1958. What sort of terms would you suggest these men should be appointed on?—If you have five Commissioners, then one should be appointed for one year, and one for two, three, four, and five years, and we would not have the board retiring as a whole. With regard to the first board, you would have one man for one year, one for two years, and the least important men for anything from two to five years. Then, after that, five-year appointments.

1959. Would you agree that, in a question of this sort or a business of this sort, it is very desirable that there should be continuity of policy?—Exactly, that is why I make that suggestion.

1960. We have seen to-day very large works going on and a certain policy laid down. When you get a change of policy you get again waste. Do you think you would get the right men to come in under an arrangement of that sort. Take the chairman, for instance, or the Chief Commissioner. Do you think you would get a really good man to come in on a five or seven year basis?—I think you would get him to come in on a seven-years' basis, because if he was a good man—if he delivered the goods—he would get the appointment again.

1961. Then you think that one Government would follow the other?—I do not say they would do that, but public opinion will have its weight in the end.

1962. You do not think he would require protection?—I think he does require a lot more protection than he has got to-day.

1963. I take it that these Commissioners should be well acquainted with New South Wales conditions—the varying conditions of the country, and the climates, east, west, north, and south, which could not be learnt by anybody, looking at the system to-day, without some considerable experience. Of course, a few years ago it was a much smaller thing. A new man could get hold of it in perhaps

a couple of years, but to-day it is a very much bigger thing?—Yes, I suppose you have found that out.

1964. I assume that your suggestion in regard to these Commissioners applies to people who are well acquainted with existing conditions?—Certainly.

1965. Has your chamber considered at all the question of a certain amount of decentralisation in the management of these railways?—Yes, that was one of the objects of which we put forward that prior suggestion you have dealt with. We took rather as a basis, the parties that drew up the suggestion, countries with somewhat similar conditions to our own, with extensive railway systems, like Canada and the United States, where they have railway systems covering vast areas, and where the conditions required in one part of the country are quite different from the conditions required in other parts of the country; and we thought that, through this board, you might have these men taking charge of certain sections and certain parts of the business separate from the other parts, like one dealing with the north and south, and another dealing with freight and so on. We have considered all that, and we think it desirable as the railways develop, for this to be done. Of course, there is the question of developing the railways with terminals other than the present terminals. There are practically only two terminals in the State at the present time—Sydney and Newcastle.

1966. When you speak of terminals you mean a sea-port?—Yes, where the railway again comes in contact with another class of carriage. There is something more than the railways to be considered there. It is the question of the port, and there is the question of the freight. Now, a lot has been said about opening new ports. I certainly agree with the opening of new ports, and they will open of themselves if they are allowed to in the ordinary natural flow of business, but a good deal has been said I think in this matter, and people are looking ahead either too much, or they have not given it sufficient thought. Now, you take the question of wool. Wool, after all, is the big industry in this State, and will be for many a day. The wool-grower is not going to send his wool to some new port or some new market simply because it happens to be near his door. It may cost him a little less in trainage, but he is going to send it to the best market where he can get the best price. The matter of trainage or freightage is a very small item compared with the competition which you get in a big market, and although it would be very convenient for him for his personal convenience, or it may be for his district, and so on, I do not think he would be prepared to sacrifice his pecuniary interests for the sake of the district or for the sake just of the sentiment of opening a new port. Take the case of the United States. There, after all, New York and Boston are the big drawing ports, and the big export and import ports. You have got Philadelphia, which does not do so much, although it was an earlier port than New York, and you come to Hampton Roads, which is only used for coaling. Now take the West Coast. You have got San Francisco, and you have got Seattle. Seattle does not compete with San Francisco except in a particular class of business, and that is the Alaska business and a certain amount of the commerce which is freighted out of Puget Sound. Now, you know San Pedro and Los Angeles is boomed, and boomed, and boomed, and if there were ever any boosters in the world, they are the people from Los Angeles. But it is simply the fact that trade will go wherever it can best be served. Now, in anything I have said to you I do not want you to get the idea that I am in any way against decentralisation, but decentralisation must be done gradually. What would be our condition to-day if we had started from all these ports—say, a port in the north and a port in the south? We could never have carried on. The overhead charges would have been too big.

1967. I take it, from your arguments, that you are looking to Newcastle and Sydney as being the only really effective ports?—Just at present. I think probably something might be done gradually to develop Coff's Harbour.

Witness—Sir M. Sheldon, 30 July, 1924.

1968. But, still, for present practical purposes, you have got the coal at Newcastle, and here you have the general produce of the States?—Yes, and Newcastle can handle a certain amount of produce, and does in fact export produce. There is another phase, too—shipping. As you know, the tonnage of the vessels has increased very largely the capital invested in them, and the probability of a boat lying a day idle is a very serious item. The cost of running a vessel is very many times greater than it was ten or fifteen years ago, both from the interest outlay and from wages and other charges. They may find it very difficult, except in certain seasons—in the export season—to use those ports, and that is why I say develop the ports slowly. Take, for instance, the case at Coff's Harbour. Undoubtedly they would have a butter export, and at certain times of the year they would have a grain export; but I think you will find in your experience here that that is limited to a few months only in the year.

1969. Still, taking Coff's Harbour and Newcastle, and assuming that the railways were decentralised, they would in all probability come within that decentralised area?—Yes.

1970. Take No. 2. You are suggesting there that the railways and tramways should be divided and become two distinct bodies. Can you tell us why?—They are quite two separate businesses, and the only similarity between them, it seems to me, is that they both run on wheels, and that they might both in some instances use the same repair shops. But, nevertheless, one is dealing with a different sort of traffic altogether—I mean street traffic as it is at present constituted—and I go so far as to say that the tramways should be under the control of the people using them. For instance, the tramways here should be brought under the control of a metropolitan tramway board.

1971. Do you not attach any importance to continuity of travel as between the railways and tramways? You see, we will be having presently a city railway running underground controlled by the railway organisation. If you take away the tramways from the railway organisation, you are going to have competition on the top?—Probably, but I think the tramways will fast disappear with the development of the underground railway.

1972. Of course, competition may be a very good thing, and in some instances undoubtedly an advantage, but, on the other hand, you have got an organisation which to-day is intermingled to a very great extent?—It is.

1973. You have got very large manufacturing establishments here which are common to both?—Certainly.

1974. And it would be rather difficult to separate them now?—It would probably be difficult but still I think the practice adopted in other parts of the world is opposed to it, and I think for them to work together would be beneficial in the end. Of course, I admit that our tramway system is a very fine system.

1975. Undoubtedly?—One has only got to travel to other parts of the world and come back here again to make the comparison; and I would like to pay my respects to the tramway people on the way they handle the traffic. Taking the difficulties that they have to encounter, the way they handle the traffic can only be described as wonderful, and it has excited the admiration of people from other parts of the world. Personally, I think the traffic is handled here better than in any other part of the world I have been to, and I have never seen, wherever I have been, anything like the efficiency with which the traffic is handled at places, for instance, like the Racecourse or the Agricultural Ground.

1976. Where they have handled 1,200 people a minute?—Yes. You do not find that in many places, and the number of accidents and mishaps are what might be called ridiculously small—fortunately, of course.

1977. Still, you think on the whole that the railways are better separated from the tramways?—Yes, I think the railway people should be railway people.

1978. After all, transport is transport, and first principles apply to both?—Yes, and I know you may also answer me by quoting the Canadian Pacific Railway as sea carriers, but still I think the railways are carrying out quite a different service.

1979. You are speaking for Sydney alone, not for Newcastle?—No.

1980. They are to deal with their own problem?—Yes, but we have not got any very extensive tramways except in the Hunter districts. They are practically railways. I do not for a moment include in those tramways such tramways as the one running from Camden and other local lines, which are really railways.

1981. Coming to your No. 3, that the Board of Commissioners should have the right of approving of new lines, do you think any Government would deny itself the right to say that a line should be built for developmental purposes?—I would still leave that power. You see, those suggestions are based on the first subject upon which you examined me, as to the board being responsible for the capital invested in the railways. I do not think any Government has the right to come a long and say, "We will go on building a railway to Timbuctoo, and then hand it over to you." Of course, that is getting back to Government control.

1982. But if they are prepared to foot the bill and to meet any loss that might be incurred, could the Railway Commissioners refuse?—That is a different matter altogether.

1983. You say that unless they are prepared to guarantee the working costs, then the Government should not have the right?—Certainly.

1984. No. 4, electric traction. We have had a good deal of evidence on that, and there is a very large scheme in contemplation?—Yes.

1985. Do you refer more particularly to the suburban area of Sydney or to the country?—We come down along the coast here as far as they run, to Nowra and that way, and they could gradually develop that. You see, the power is there ready for them.

1986. You refer to the power which is available pretty well everywhere from the Queensland border down to Victoria?—Yes, and we know it is interchangeable. You have the steam when it is not convenient to apply electric power—I mean freighting along and the haulage. I think, too, that we would be able by that, amongst other things, to haul bigger loads.

1987. You mean to get over your mountain grades?—Yes. I know the first capital expenditure is big; but take the case of Milwaukee and St. Paul. You probably know better than I do what have been the latest results there. At first they had a bit of a set-back on the capital, but I think they have turned the corner now, and they have carried through, too, on pretty tough country, not the best in the United States. From my recollection, and I have been over the road four or five times, I think there is forty-eight hours or probably sixty hours of pretty bad country, where there is not much habitation around.

1988. And it is very hilly?—Yes, and that is where the rivers start mostly, and there is also very heavy snow.

1989. I see you have mentioned here that maintenance is lowest under electric traction. Have you got any distinct evidence of that?—I am not an expert in that way. From what I have seen at Harmon, on the Hudson River, on the New York Central, it is so. They run out about 30 miles, and nothing comes into New York in the way of a passenger train on either of those four roads, and most of their freight for 35 miles, and the engines or the motors comprised in that and building are not occupying any greater space than the ground floor of this building here, the Chief Secretary's office. I have been in there at various times—half a dozen times—and I do not suppose in the repair shops there, of one of the biggest systems in the world, there are more than 100 men employed. Of course, it means constant supervision. Every engine is looked after constantly after every run, and I understood from

what I heard that the cost of maintenance was not to be compared with the cost under the old system—in fact, they would not like to compare them with the old system. Of course, I admit that in America they have other great difficulties, but that is the evidence I have heard.

1990. You see, the electrician would look at it from one point of view and the man who had to keep the road going from another?—There is another feature, too, about that electric traction. There is no question about its comfort and cleanliness. For instance, going along in the sleeper at night, there are none of the troubles of getting bumped out “head on.” I lived at one time at the Yale Club in New York, which is right over the New York Central Railway Station, and I never heard a noise all the time I was there, and there was a train going out every minute.

1991. From the public point of view there is no question of the advantage of the electric working. As to what you suggest in No. 5, I have been informed that the Commissioners have that power and have exercised it?—In No. 4 we asked you to give special consideration to that. We do not pretend to be experts on the matter, and at the same time we have made this suggestion simply for you to take into consideration how the overheads might be cut down by the selling of power and the development of power in this country.

1992. That is in the country districts, side by side with your railway power?—Yes.

1993. In regard to this, you say consideration should be given to the building of modern motor traction roads. I am afraid that is not within our terms of reference?—It ought to be, if I may say so.

1994. Possibly the question of using motors upon motor roads is within our ambit. Do you suggest that the railway administration should use motors for the purpose of carrying passengers and merchandise to and fro from stations in the country?—No, I do not go as far as that, but we put it in No. 6, “the desirability of . . . existing lines.”

1995. That is distinctly outside our reference?—Yes, but we suggest that you should take into consideration that phase of what is outside and affecting the railways. I do not see how you can avoid it. It may not be within the scope of your commission, but we respectfully suggest that it ought to be. Say they are going to build a railway from one point to another, and it was suggested that it was wanted. The railway people say, “No, we cannot build a railway anywhere near the cost as we can build a motor road for the traffic you have there to-day,” and I think that many of the railways that have been built would have been better if they had been roads, on such as the small spurs—I do not refer to the main lines—and I think that many of the suggested railways referred to the Public Works Committee would have given better service with roads.

1996. And you would leave it to the public to find their own vehicles?—Yes, I would. I do not object to the Railway Commissioners finding a box or truck, something that is lifted from their truck to an ordinary motor truck and sent away. A container, such as you have in England, carriers of about half a ton.

1997. In No. 7 you say that you think the Railway Commissioners should come under the Common Carriers Act?—Yes.

1998. The Railway Commissioners, according to their last published report, do pay a good deal away in compensation—£11,000 in the year, I think, was the last figure?—If it is only that figure it is wonderfully small, and it shows very good control.

1999. Do you think they should come under the common law?—Yes.

2000. Do you know if the other States of the Commonwealth come under the common law as far as railways are concerned?—I could not say.

2001. It was suggested in one of the letters you handed in that in Victoria they do come under the common law?

—I cannot say that from my own knowledge, but I can get that information for you if you require it.

2002. It is rather an important thing to know what the other States do in a matter of that sort?—Yes.

2003. Perhaps in conclusion you would like to say something with regard to the present Chief Railway Commissioner and the way his duties have been carried out?—Yes, I think it is only fair to say that he has carried out his duties, as far as we gentlemen can see, and with the machinery at hand and the conditions under which he works, in a highly meritorious way. We cannot speak too highly of the way he has carried out his duties. He has had to contend with many difficulties, and it is apparent to everyone that he is a man of experience, and does not fly off at any tangents on to any particular theory. I think he has shown wonderful discretion throughout the whole of his term of office, and he has had a very trying time. I do not want to refer to any political aspect of the matter for a moment—each one is entitled to his own particular view as to how a thing should be done—but Mr. Fraser has had certain conditions to work under, and I do not know, nor have I ever seen, a man who could have given better results than he has under those conditions.

2004. Sir VINCENT RAVEN: I do not think it is necessary for me to enlarge on what Sir Sam Fay has said or brought out in connection with the financial side, but there is just one question I would like to put to you in connection with (d) in No. 1. I take it from what you have said that you rather suggest that the Commissioner and his assistants should work somewhat on the same lines as the president and vice-presidents of railways in the United States and Canada?—That is so.

2005. I notice amongst the duties of the Commissioners which you have suggested there is nothing said about anybody who is experienced in mechanical or electrical work. Now, from my knowledge, after going several times to America and seeing the railways, on a number of those visits I have noticed that officers have passed through the mechanical side before they come to the operating and more important side, and it appears to me that it is a department which spends an enormous amount of money, and in these days, when mechanical and electrical engineering are the basis of nearly all industries of every kind, that someone who has that knowledge ought to hold a position as assistant to the Chief Commissioner if anything of this kind was carried out. I would like to hear what you have to say upon that question?—Really the consideration was a maintenance man or a construction man. That is what we had in view, but it has been badly expressed. That is all I can say.

2006. What one would generally understand by a construction or maintenance man is a road-maker and bridge-maker?—Undoubtedly. We meant a mechanical man. Personally, as far as my own personal knowledge goes, I remember when I was Commissioner in the United States and they were asking me to secure a man in America to come out and report on the railways—the uniform gauge—it was a mechanical man who was the man I was after all the time.

2007. It is really the mechanical man who is coming to the front in engineering in these latter days?—Of course, it must be.

2008. With regard to No. 2, in connection with your proposal that railways and tramways should be separated, do you not think, more especially as electric traction is coming forward upon the railways, that there is a greater similarity between the electrical side on the trams and the suburban traffic on the railways; and if you agree that that is so, would it not be more economical to utilise the workshops that were dealing with the one for the other?—I recognised the fact that probably we will see all our suburban railways electrified within the next few years. That must be the tendency, but still I do not think that it is the same class of business. Of course, we have to a large extent grown up here on what might be classed as mixed traffic. The goods traffic has not been separated, and in

Witness—Sir M. Sheldon, 30 July, 1927.

the city there are other classes of traffic. Of course, some of the difficulties might be got over by the decentralisation referred to by Sir Sam Fay, but still I maintain that it is a different thing.

2009. I am referring more specially to the maintenance, upkeep, and renewal of the stock, which I think you will agree is a very important item, and which will show very largely in that balance-sheet which you speak of, being worked in the most economical way, and I suggest that it would be more economical to have such similar work performed in the one workshop rather than dividing it up and multiplying it?—That is based on the idea that all the work and construction is going to be done by the Commission—I mean the mechanical construction. Personally, I think it would be very much better for the State if there were more private enterprise, more competition. You referred a moment ago to the question of the mechanical engineer coming more into prominence every day. Unfortunately, that is not the case here. What I am referring to is rather off the track, but I would like to say it. Where can an engineer get employment in this country—I mean high-class employment—as in other countries? He has got to go to the Government, and then he has got to wait upon seniority. We have a great engineering school at the University, but that is only producing graduates to go to America and to obtain positions elsewhere outside this country. I think, just as in other countries, private enterprise should be allowed to compete for the construction of a lot of this work, and I think better results would follow, not only in the railways and tramways, but it would also develop industry in this country which might expand in many directions.

2010. But what I have said does not suggest that electrical equipment or anything of that kind should not be bought outside. I am speaking of the necessary maintenance and repairs which would have to be carried out in the railway workshops?—There is only one answer to that question. They are very similar occupations, but I still think that they are two separate means of conveyance—the tramways and the electric railways.

2011. Now leading out of what you have said just now, I would like to ask you, is it your opinion that as much work should be bought outside as possible, and that the Railway Commissioners should not set up a manufacturing department where they could buy cheaply outside?—I certainly think so.

2012. I am talking now about locomotive work generally?—As long as they could see that there was an effective supply from private enterprise—not from one firm, but provided there was reasonable competition. I do not think that that work is part of the railway business. The railway is a carrier—it is not an engineering shop.

2013. Your idea is that they should not set themselves up as competitive manufacturers?—That is so.

2013A. WITNESS: Another feature about that is, I think you will agree with me, that it stops enterprise and emulation—there is no competition, and you get nothing new.

2014. Sir VINCENT RAVEN: You have suggested that consideration should be given to a considerable increase in electric railways?—Yes, that there should be a consideration of that subject.

2015. I myself have been over the railway you refer to in America viz., the Chicago, Milwaukee and St. Paul, which is the biggest electric railway there is in America. The information which I received there was that it certainly was a very paying concern, and the only thing that they were waiting for in order to connect up those 400 miles of line was money, and not because it would not give a good return. Well, now, the whole question in converting from steam to electricity is the enormous capital involved?—Yes, that is so.

2016. The New South Wales railways have, I understand, a considerable scheme of electrifying immediately around Sydney. Would not you agree that it would be better to push that forward as quickly as possible to see

the result of that in a congested area before considering other parts of the line at the same time?—Yes, certainly. I agree with you entirely. Of course, I do not pretend to have any expert knowledge, but in places along the South Coast and between here and Newcastle I should like to see it tried; also I should like to see it tried over an area such as that to Lithgow, where you have coal on either side of you and power on either side of you, and it is a question whether that would not solve some of our gradient problems.

2017. There is no greater advocate of electrical traction than I, but I should like to know from you whether you do not agree that it is better to deal with this congested area before trying experiments on other areas?—Yes, I certainly do; I think it is there where it is more effective.

2018. With regard to the roads, I was not quite clear whether you suggested that the State railways should make the roads in order to feed the railways?—No, I do not think that that is their business. What I meant was: that in any future extensions of railways it should be considered as to whether it would not be better to have a good modern road fit for motor traction, and to keep that in view all the time, and for the railway to keep out of it, and say, "You people can build your own road, and we will receive freight from you at this point and will give you every facility that we can." I think that in that way the State would save a great deal of money.

2019. Sir SAM FAY: You were referring to the railways not competing with manufacturers. I presume you referred to manufacturers in Australia?—Yes, certainly. I believe they can build practically anything here if they are given encouragement. I believe the policy of the Government of building Government workshops is stopping the enterprise of individuals who sink money in this way without any risk to the taxpayer. At present the taxpayer is paying for these things. We all know that in these enterprises only a certain percentage are successful, and the taxpayer foots the bill all the while in this country, and very often we do not know whether the ventures are successful or not.

2020. Do you not think that the railway administration has been rather forced into manufacturing because of the distance from the base of supply, either Europe or America?—Yes, that was the case at the start, but now, with modern developments in industry, the question is quite a different one—it is quite different since Federation. For instance, there was practically no manufacturing in this State before federation, whereas the "key" manufacturers within the last twenty years have come to this State, and this is the primary State. Previously practically the only large engineering works we had were Mort's Dock, whereas now you have only to look round and you will see that the buildings now are all modern. Of course, we did have a few railway-carriage builders, and we had the works at the Clyde, but there was not always the support for them, in addition to which they had pretty good competition from America for their engines.

2021. Dealing with these letters which you sent in—the first one deals with fares. The first statement is that fares on the Victorian railways in the neighbourhood of Melbourne are about half what they are here. That is a matter which we will have to go into in the ordinary course of our inquiries?—That is only a matter of accountancy.

2022. Then there is a complaint, which we have already gone into, of the rates and fares from Goulburn to Melbourne being the same as from Sydney. Do you wish to say anything about that?—No. I conclude you will look into that also.

2023. Then there is the question you have already commented on, namely, the common carrier. There is a statement made there that in Victoria they accept the conditions of the Common Carriers Act?—Yes; well, I am a little doubtful about that, but I will find out.

2024. Then there is the question of rates, and there is a complaint which crops up in other letters as to the time at which goods are received at Darling Harbour?—That, unfortunately, is the incidence of certain legislation. I suppose the Commissioner is trying to keep down his cost, but in keeping down his cost they are causing great loss to the public—I mean that on account of the limitation of hours for the delivery and receipt of goods certain time is lost which is dead time for certain people in the city here. It would be revolutionising their business to make their hours suit the railway hours; it would mean upsetting the whole economic situation. I think you will find that by the Commissioner saving, say, £10 the public are incurring £20 by the present times.

2025. There is a complaint also about weighbridges?—That crops up all over the world—the weights at one end as against the weights at the other. That is one of the greatest sources of complaint. There is a great tendency in weighbridges for something to get out of order, or perhaps the tare is not quite right in the waggon, and so on. I know there are complaints, and sometimes what makes it hurt is that the case is a serious one—it may have been a theft, it may have been gross negligence in the tare of the waggon that went there.

2026. Is it that they want to make use of the railway weights for selling purposes?—Yes, they do—many of the contracts are on railway weights. For instance, you sell a man so many tons of goods. You may have weighed them in the city, but he gets his weighbridge weight from the railway, and he says that is different. Of course, one may have been weighed a mile or two away, or there may have been some carelessness in the tare of the waggon; there is often so great a difference as 28 lb. in a couple of tons.

2027. Have you no law here imposing a penalty on people using false scales?—Yes, we have. But it is not false scales; very often it is the tare of the waggon which is at fault, and that is where I think a lot of the trouble arises—I know that when I was in charge of wharves the trouble arose in the tare of the waggon. Most of these waggons have the tare marked on them; well, a man may have put something on his van at one place and dropped it at another—you never know what they do—very often quite thoughtlessly and unintentionally. When I was in constant touch there, the practice used to be to have a tare every day. I am referring to the road vehicle; that is where most of it occurs. The practice is for a horse team or motor truck to go into the railway, where it is weighed gross, and then they tare him when he comes out; or sometimes the man in the city, when receiving the goods, reverses that order, and tares first and then gets his load and tares afterwards. Well, in between there may have been some alteration in the tare—*e.g.*, in the old days, where a man had a four-horse team, he probably had 1 cwt. of feed on, and he may have fed his horses in the meantime. Things like that occur, and it is not always the fault of the Railway Department.

2028. Here is a gentleman who indulges in very high language. He speaks of the juggernaut—of the trollies which in the hands of hurrying porters on railway platforms, often loaded with small parcels, play havoc with the shins of passengers, and he suggests that they should be replaced by overhead trollies?—I have never seen overhead trollies in operation wherever I have been.

2028a. There are some in some parts of the world. He also complains about the railway administration breeding rabbits on the line?—That is a constant source of complaint in the country. That rests largely with the individual ganger in charge of that section as to whether he looks after the rabbits on the line or not.

2029. Another statement says that “the Department does not have the staff in uniform”—that they cannot tell who is the railway man and who is not?

2030. Sir VINCENT RAVEN: Yes, that is rather an important matter, I think?—Yes, it is. Sometimes, when travelling in the country, you may have noticed persons

walking about wearing a tweed cap, and, in hot weather, with their coats off. He may be referring to that. Also he may be referring to the red cap.

2031. There is a complaint here about trains not running to time—being in some cases half an hour late; what is your experience with regard to time-keeping?—In my experience the time-keeping is pretty good. I do not say that it is altogether up to the English standard, but over there you have such short distances, yet even so I have been many times late in England. I go to Melbourne about every two or three weeks, and I cannot remember being five minutes late on one occasion when getting into Melbourne or into Sydney—that is, within the last six months.

2032. Would you say that there is a small proportion of engine failures and breakdowns?—There was a good deal of difficulty in regard to engine breakdowns, but I think that state of affairs has been gradually overcome.

2033. They say here that engines are breaking down too often to replace them, and possibly these do not get overhauled often enough. Have you considered that at all?—I cannot say that I have travelled much on the suburban lines, but I have not heard many complaints about it. The press is generally pretty prompt in ventilating anything like that in the newspapers in this country. Certainly, after the war, the railway engines had got pretty low, owing to the starving of supply of money to the Commissioners, with the result that some of the engines were breaking down pretty often; latterly, however, I do not think there has been much of that.

2034. With regard to sleeping accommodation, are there many complaints with regard to that and as to the difficulty of getting sleepers?—Yes, there is a good deal of difficulty about that, but that is at seasonal times—*e.g.*, a lot of men may want them just to go to the races, to go to Melbourne, and so on. Sometimes if you try to book a berth to Melbourne you may not be able to get one, because all are booked up. But I have suffered that way when travelling in America quite often. I have seen people unable to get a berth in a train, even in the case of the Pullman Company.

2035. These people refer rather to the mail trains, I think?—Yes; well, those are practically the only trains that carry sleepers in New South Wales.

2036. Sir SAM FAY: In another letter they ask for second-class sleepers?—Yes, there is no reason why a person should not have a second-class sleeper, I suppose; whether it will pay or not is of course a different matter.

2037. Of course, that is a question of adding weight to the train?—Yes. I think what they mean is to adopt the principle. Well, you have a second-class ticket and are going a long distance—go and pay extra for your sleeper; and they will quote you the case in America. But, as we all know, there is only one fare there—I mean, there is the basic fare, after which come the extras, *i.e.*, the sleeper and the chair car. That is what they refer to; they do not know that they are getting a concession on their ordinary freight.

2038. They rather refer to the second-class sleeper being in use in Queensland; do you know anything about that?—Yes, I have seen them once or twice on certain lines there; but of course the Queensland railways do not pay.

2039. You agree that it is largely a matter of expenses?—Yes, and a difficulty of carrying heavy trains over the gradients they have here. I do not think you could give a second-class sleeper with a second-class fare, if you expect the railways to pay—that is, even if he pays the ordinary rate of 12s. 6d., or whatever it is for a sleeper.

2040. Sir VINCENT RAVEN: Is there more difficulty in regard to ladies getting sleepers than men?—In the old Pullman sleepers that they have here they curtain off so much space at the end of the car for the ladies, and if they have to curtain it off they have to take four berths, and if there is only one sleeping-car on the mail train that is a

Witness—Sir M. Sheldon, 30 July, 1924.

difficulty. Of course, men naturally, owing to their vocation, travel more at night than women. There are more men travelling than women and there are more men's sleepers than women's sleepers.

2041. Is the trouble more emphasised, so far as ladies are concerned, than men; that is what they say in this letter?—Well, I have so very little to do with ladies that I do not quite know. Naturally, ladies do not travel so much as men, but apart from that, amongst my lady friends I have never heard of them not being able to get a lady's sleeping ticket. I tell you frankly, I do not think there is much difficulty in that direction. Of course, you know what is always said about booking; i.e., kissing goes by favour, and the usual habitue, or the man who is always booking, gets the best berth, and it is very often in that manner that these things get about. But I do not think there is any cause for complaint in that.

2042. As to the question of the engines being of an obsolete character, what do you say?—I am not sufficient of an expert to be able to answer that question. I know that they are always replacing engines.

2043. Sir SAM FAY: There is a complaint with regard to rates which are charged on certain classes of imported merchandise. As we have it here, the Federal Government imposes a Customs duty on certain articles?—Yes.

2044. The complaint is that when they are conveyed over the New South Wales railways they are charged more than the same article conveyed under exactly the same conditions locally manufactured. These are complaints against that practice. I take it there would be two views in New South Wales on that subject, would there not?—Yes, quite.

2045. That is, the view of the man who pays for the imported article and the view of the manufacturer here who wants his products protected?—Yes, that is so; then there is the view in certain cases of the buyer in the country who has to pay more. The question is really a political one; it is a question of State policy. The policy of the country is undoubtedly a policy of protection, and of course that is one of the difficulties which the railways are working under.

2046. There is a suggestion here that tourist travel should be encouraged by running trains longer distances into the country without stopping?—At certain times of the year there should be facilities in that way. I have no doubt the Commissioners comply with that requirement, having due regard to the expense involved, of course.

2047. The next suggestion is that a dining-car should be run on some of the trains on the main lines. At the present time the Commissioners provide refreshment-rooms?—Yes. They did run a dining-car some years ago between Sydney and Moss Vale, I think, but it was not patronised, and so it was discontinued. In connection with the suggestion of dining cars on trains we have to recollect that all our mail trains, with the exception of the Brisbane, leave at night time after the meal hour, and they all arrive at their destination in the early hours of the morning. That is the present system. If people were sitting up they would not want a dining-car in the middle of the night. In saying this I am taking Sydney as the terminus, and I should think it very doubtful whether a dining car is required. Then it must be borne in mind that the haulage involved in those things is very great, and it cannot be done without expense. Of course, people go to the United States or to England and they see dining cars there. Well, the dining car on the trains in America is part of an institution—people wait to take their meals in the dining car in order to save time, and they do not mind what price they pay; but the way our railways are at the present time I do not see how the provision of dining cars will pay the Commissioners. Of course, you might, as a trial, put on a dining car between here and Newcastle. With regard to the trains from Melbourne, they get in to Sydney about 10.20. Well, a man does not go to a dining car for his breakfast—I think he generally has something light—so that I do not think a dining car would

pay in that case, but it might possibly pay between Sydney and Newcastle.

2048. Take the tourist traffic to the Blue Mountains—Katoomba for instance; early trains are started from there, are they not?—Yes.

2049. Would not it be an advantage to run a breakfast car from there?—Yes, you might run a club car—not a dining car—from there—a car where you could get coffee and rolls or scones, toast and jam, and things of that sort, but not to provide a heavy breakfast.

2050. Then there is a complaint as to the labelling of first-class carriages second?—I suppose that if they have not enough second-class carriages they have to carry the second-class passengers somewhere.

2051. So, the first-class traffic is decreasing?—I should not say that it was.

2052. That is the evidence we have got now?—It may be, but when times get moving a bit and people are on the up-grade as regards money they will swing back again.

2053. Sir VINCENT RAVEN: Is there much difference between a first-class carriage and a second-class?—Not in the newer ones.

2054. Then, what do people pay for in a first-class carriage?—Well, some people do not like to travel with a Chinaman, or for some such reason as that; also a man very often in a second-class car thinks that there is a different set of manners—I think there is a lot in that. Of course, there is no trouble like that in other countries; for instance, in the suburban trains in America, in which they have all one class, except, of course, where you get below the Mason-Dixie line and have the "Jim Crow" cars.

2055. Sir SAM FAY: Then there is a complaint from one of your members of competition with the sea, and this letter starts by saying that the railways are run at a loss. We have not found that, up till now?—No, there is documentary evidence to the contrary. I know that the gentleman who writes that is a very able man and one of our best freighters.

2056. He makes certain statements here as to things which we are analysing, but his first statement obviously is wrong. Then the Campsie Chamber of Commerce complains of the absence of proper connection between trains and trams?—That is rather against my argument a moment ago, and you, gentlemen, will get your halo if you devise something to make those things meet.

2057. Then there are suggestions with regard to the maintenance of new lines, but that is not within our province. Then there is a complaint about the Adamstown-Belmont railway agreement. I think that is purely a question of the construction of an agreement, with which we have nothing to do.

2058. Sir VINCENT RAVEN: One letter comes from the Chamber of Commerce and Industry, Illawarra, and complains about the couplings on the doors of hopper waggons being difficult to close, and says that in private-owned waggons this inconvenience does not exist; have you anything to say about that?—I am afraid not, because I do not know what the coupling is, in that case, to be quite frank.

2059. Is it of sufficient importance to ask us to look into it; I mean, I know sufficient about these troubles and complaints as to railways to know that a great number of the complaints are not worth while bothering about?—Well, sir; if you are satisfied that there is effective control in the mechanical department I do not think you need bother about anything further.

2060. I am sure that I am not going to look at all the couplings to the doors of waggons to see whether I consider them satisfactory or not.

(Witness retired.)

(The further proceedings were adjourned till Thursday, 31st July, 1924, at 10.45 a.m.)

## THIRTEENTH DAY.

THURSDAY, 31 JULY, 1921.

(Held at Chief Secretary's Building, Macquarie-street, Sydney.)

## COMMISSIONERS :

Sir SAM FAY.

Sir VINCENT L. RAVEN.

REGINALD HARRY STRINGWELL ATTWILL,  
Superintendent of Passenger Transportation, New  
South Wales Government Railways, sworn, examined,  
deposed:—

2061. Sir SAM FAY: You are the Superintendent of  
Passenger Transportation?—Yes.

2062. Do you control the running of the passenger  
trains throughout the whole of the railways?—Yes. We  
arrange the time-tables for them and the loads.

2063. Of passenger trains?—Yes.

2064. And you arrange the load in conjunction with  
the Chief Mechanical Engineer?—He arranges the load  
the engine will haul. We arrange a suitable load for the  
passengers' offering. We provide the seating accommoda-  
tion. I see that sufficient is provided and that there is  
no waste.

2065. How do you get the sufficiency?—Trains are  
counted at different points daily, the number of passengers,  
first and second. I get that, and that is my guide.

2066. You deal with the trains not only from Sydney,  
but from Newcastle and other places?—Yes.

2067. Do not you find your duties conflict with the  
responsibility of the District Superintendent?—No, it is  
more of a check on them.

2068. Do you arrange the time-table in conjunction with  
the District Superintendents?—Yes. We put the pas-  
senger trains in the time-table first and then they fit their  
goods trains in. We check the time-table for the goods  
trains to see if we can improve it.

2069. When you arrange the time-tables do you have  
a meeting to decide on the times of the trains with the  
District Superintendent?—Not with the passenger trains.  
They give us a written recommendation and we discuss it  
when they come down to conference.

2070. They tell you the passenger traffic requirements  
of their district according to their views?—Yes.

2071. You arrange the time-table in accordance with it?  
—Yes.

2072. What trains do you fix the time for?—The ex-  
presses first, then the long-distance trains, and the short-  
distance trains.

2073. You make your ordinary train service revolve  
round your Melbourne and Brisbane expresses?—Yes.

2074. Do you deal with any complaints which come  
from the public in regard to accommodation?—Yes. The  
Chief Traffic Manager sees them also. I prepare the re-  
plies generally.

2075. Do you have many complaints?—A fair number.  
Many of them are trivial, and we explain them and they  
are satisfied.

2076. Do you deal with delay of passenger trains as  
well?—Yes, through the District Superintendents.

2077. You get a good many complaints in regard to  
that?—No so many in regard to the long-distance trains.  
They are generally in relation to late arrivals of suburban  
and workmen's trains.

2078. Do you get any complaints in regard to your night  
trains, as to the accommodation being comfortable or not?  
—Not a great number.

2079. So far as you know, are the people living far out  
in the country satisfied with the accommodation of your  
night trains?—Most of them have to travel by night.  
The majority have no complaints. Odd complaints are  
made about the type of vehicle.

2080. Do you consider they are satisfied with their  
present train service, which, in some instances, is only two  
or three days a week?—I do not say in every case. Some  
wish for an improved train service, and we have applica-  
tions in that respect.

2081. Are you held up by shortage of travelling stock?  
—We are short at times.

2082. Short of passenger accommodation?—Yes.

2083. Does that apply to your main-line trains as well  
as suburban?—Suburban principally. To the main-line  
trains we give preference.

2084. You have to run suburban carriages on your main  
lines sometimes?—Yes.

2085. That is not satisfactory?—No. There are com-  
plaints about that frequently. That is chiefly on holidays  
and week-ends.

2086. Do you issue all these special train notices in  
regard to passenger traffic?—Yes.

2087. Even those which are running 400 or 500 miles  
if in the country?—Yes. There may be an odd one, a  
divided train, and at holiday time, that we do not issue.  
Generally we issue all of them.

2088. How do you manage to get the notices out into  
the hands of the staff when you are running a train to  
Murwillumbah?—The Superintendent issues them from  
that side of the Clarence River. That is my oversight.  
Up to as far as South Grafton we issue them, but not  
generally on the other side of the river.

2089. How do you manage to get out your special train  
notices?—We get early advices and we send the notices  
forward by special envelope. We have no difficulty in  
that respect.

2090. When you are timing a special passenger train  
do you run them without consultation with the District  
Superintendent?—No, he submits a proposal and we check  
it. Sometimes we alter it, but not often.

2091. Do they conflict at all with the running of the  
numerous goods trains?—Occasionally. Of course, the  
passenger train takes preference. They do not delay  
the goods trains. They will alter the working of the goods  
trains to fit in.

2092. Do you consult with the Locomotive Department  
in regard to fixing the time of the special trains?—The  
specials in the country we have to run to suit the people  
who want them. We try to fit in with the locomotive  
arrangements to avoid additional expense. We give the  
Locomotive Department a proof of the special arrange-  
ments generally.

2093. The engines for the passenger service are under  
the Chief Mechanical Engineer entirely?—Yes. Although  
we do consult with them in connection with the allotment  
of different types of engines.

2094. You deal with orders for horse boxes, motor  
trucks, &c.?—Yes.

2095. Are you short?—No. When we have a rush we  
convert some of our bogey goods trucks.

2096. That is to motor-car trucks?—Yes.

2097. You also control sleeping car equipment?—That  
is, the rugs, water bottles, sheets, pillows, &c.

2098. You control the sleeping-car linen?—Yes.

2099. Do you get complaints in regard to the linen?  
—No.

2100. Are the people satisfied with their beds?—So far.  
Occasionally they complain about the hardness of the  
bunk but that is all.

Witnesses—R. H. S. Atwill and W. C. Quinton, 31 July, 1924.

2101. How often do you recondition your bedding?—They are guided by the condition of the mattresses. As soon as they get hard or lumpy they are taken out.

2102. Who examines them?—The locomotive men have an officer and I have an officer. The locomotive branch does the conditioning.

2103. Who is responsible for taking the mattresses out?—We have a carriage inspector, and he makes the examination of the beds. He is under me. The Locomotive Department also has an officer who makes an examination of the mattresses; we check that officer.

2104. You issue printed circulars in connection with the works and progress of the works, opening of new sections, stations, or sidings?—Any works in progress, and they want a connection with the main line, we issue notices to the staff telling them what has been done. When the work is completed we issue a notice regarding the working of those particular places.

2105. That includes the signalling too?—Yes. If it is a big work it is included in the weekly notice. We issue about 400 circulars a year.

2106. Do you prepare amendments and additions?—Yes.

2107. Your instructions are very elaborate. Have you had experience on any other railways?—Not working on them.

2108. Your instructions are very numerous, very detailed, and very elaborate?—Yes.

2109. Taking an ordinary employee out in the country looking through those instructions, he would be somewhat puzzled until he got a good deal of experience. You are adding constantly to those instructions little matters of detail which might be dealt with locally. They are very numerous?—The alterations and additions are numerous.

2110. It would take some time to get it all into your head?—It would not be possible. The books are for reference purposes.

2111. Are you responsible for the instructions in regard to where shunting and crossing should take place?—I prepare these instructions for the Chief Traffic Manager, who deals with them.

2112. You give detailed instructions that certain things are to be done at a particular station, or between one station and another. Are you responsible for those?—The Local Appendices contain those instructions; they were issued before my time.

2113. What voice has the District Superintendent in that?—He is consulted. The district superintendents check all the proofs. Their suggestions are carefully considered.

2114. You are really acting as an assistant to the Traffic Manager for traffic purposes?—Yes.

2115. Sir VINCENT RAVEN: Are you generally satisfied with the locomotives, dealing with passenger trains?—We have a number of failures.

2116. They can haul the trains at the weights and the speed which you require?—If we had more powerful engines it would save pilotage. In cases one engine is not strong enough.

2116A. Train delays due to locomotive seem to be very large?—I do not think the percentage is particularly high.

2117. As a matter of fact it is particularly high. It causes you inconvenience?—It causes the public inconvenience.

2118. In regard to the beds, so far as the Locomotive Department is concerned, it is in connection with the fixed beds, the springs in the bed, they have to satisfy themselves?—Movable mattresses.

2119. Do they supply those?—Yes.

2120. They supply them in the first instance. Are they responsible for seeing that they have got the right mattress there?—We are responsible for seeing that there is a mattress for each bed. The conditioning and renewing of them is done by the Locomotive Staff. If we see anything wrong we ask for another.

2121. How are they responsible after it has got into the carriage?—They have a man who goes through the carriage.

2122. That is doing the work twice over?—He examines the fittings as well.

2123. The movable mattress—is it not doing work twice over if he does it and you do it too?—In one way it is. We make a check on him. It is advisable probably to have a check on the examination of mattresses to avoid them getting into a bad condition.

(Witness retired.)

WILLIAM CHARLES QUINTON, Superintendent of Goods and Livestock Transportation, sworn, examined, deposed:—

2124. Sir SAM FAY: You are responsible for the goods and livestock traffic under the Chief Traffic Manager?—Yes.

2125. You supervise the goods train service, which embraces the running of all trains conveying livestock and perishables?—Yes.

2126. Are you responsible for the loads of engines employed?—Yes, in conjunction with the Chief Mechanical Engineer we determine the loads.

2127. You are the officer on the traffic side who consults the Chief Mechanical Engineer?—Yes.

2128. Do you fix the time of the goods trains?—That is really fixed by the Superintendent of Passenger Transportation.

2129. Not goods trains?—They are really fixed in the various country districts by the District Superintendents, and in the metropolitan area the same applies. If there is anything which requires to be determined it is submitted to me for consideration.

2129A. That is to say, the Passenger Superintendent has the choice of the road, and the goods trains have to be fitted into that?—Yes.

2130. You deal with undue delays to trains and engines?—Yes.

2131. Does that mean that out in the country, where engines are kept out, say, for a week from their home station, you deal with that?—Yes.

2132. With whom do you deal with it?—With the Chief Mechanical Engineer and with the District Superintendent, and with the District Locomotive Inspector concerned in that particular district.

2133. The really responsible officer for keeping an engine out an undue time would be the District Superintendent?—Not necessarily.

2134. Who else?—The locomotive people frequently. We might send an Enfield engine to Broadmeadow. It is prepared to return to Sydney. Something may happen to a Broadmeadow engine which is prepared to go to the North Coast, and they grab the Enfield engine. That would be done by the Locomotive Department.

2135. Are you sure?—Absolutely. That is detected within a few hours, and we want to know from the locomotive people why they sent that engine away, and we issue directions that the engine must be returned as soon as possible to its home depot.

2136. We have been rather given to understand with regards to goods train engines, the Locomotive Department are asked to allocate a certain number of engines to a depot. After they are so allocated they are controlled absolutely by you?—That is as far as the ordering is concerned.

2137. So far as the working of the engine is concerned?—Yes. We determine that. As far as that individual engine is concerned, if she got to Hamilton and Loco. were in a tight way, they would take it and send it north or north-west as the case might be.

2138. They would tell you that is the only engine they have got?—Yes. Their running repairs may be somewhat excessive at the time.

2139. Do you get a great many complaints with regard to engines being sent away from their home depot?—Yes. That is carefully watched by the Chief Mechanical Engineer's staff. We are always on the alert for it, and even if we were not, he would give a strong reminder about the necessity for getting it back.

2140. You are responsible for engine men on duty unnecessarily early?—We have a return of engine-men signed on duty to work a train and they may be on duty 30 minutes too early. That is debited as unnecessarily early against that particular depot. The various District Superintendents, together with the locomotive inspectors, are responsible for submitting the details of each case. Those cases are personally investigated by the District Superintendent and the District Locomotive Inspector.

2141. You mean that the engine-men turn up before their proper time?—They book up at, say, 1.30, and they are allowed a certain time to prepare their engines, about 45 minutes. They are standing and waiting in traffic 30 minutes unnecessarily. They are allowed, say, 15 minutes to attach to train and test brakes. If they are standing 30 minutes over that time it is debited as unnecessarily early.

2142. You have a train, say, timed to leave the depot at 1 o'clock. The engine-man is supposed to be on duty 45 minutes before that time to prepare the engine and get out on the road?—Yes.

2143. That is 12.15?—Yes.

2144. If the engine-man turns up at 12.15 could he be unnecessarily early?—Yes, because the train may get away late. A stock train may be running into Werris Creek from Armidale. She loses time en route after the station-master, Werris Creek, has ordered the engine out to leave at a certain time. If that train loses time from locomotive or traffic causes, we treat it as a case of unnecessarily early, providing engine was waiting 30 minutes or longer.

2145. You do not suggest the engine-men are responsible for that?—No. The idea of keeping that record is to provide for the most economical working. If we were to allow depot station-masters to order out engines indiscriminately it would cost us something.

2146. In a case of unnecessarily early, the responsibility lays with the station-master. He should have called that man out, not at 12.15, but at 12.45?—Whatever time is necessary. He must put the men back. He should ascertain how a particular train is running, and it is his responsibility for notifying those men in due course they will not be required for a certain time.

2147. Sir VINCENT RAVEN: How long would he know that that train was going to come in late?—It is quite possible he would not know in sufficient time in many instances, because they are entitled to 2 hours' notice at their homes. Wherever it is possible we insist on them putting the men back in order to save the cost of standing.

2148. Unless he knew in time to give notice no fault could be found?—That is so. We want to know whether there is any negligence on the part of the staff.

2149. Sir SAM FAY: It is a check on your own traffic staff?—Yes. The enginemen are not in any way responsible.

2150. Sir VINCENT RAVEN: What is the time which is considered reasonable to ask a driver after he has been called on duty for a certain hour to be put back?—Once he is called we do not put him back. He is entitled to two hours' notice in accordance with the award.

2151. Do not you give him any more than that?—No.

2152. Night or day?—That is considered sufficient.

2153. Sir SAM FAY: You control the goods and live-stock waggons throughout the State?—Yes.

2154. Have you enough live-stock waggons?—At the present time more than enough. I have 700 standing idle. During drought periods we find we have not sufficient.

At the present time we have under construction 300 additional sheep vans. During the drought periods, to relieve cases of extreme urgency, we place open waggons in the trade.

2155. What number of live-stock waggons would be necessary to enable you to tide over a drought period such as 1922-23?—It would be a high figure. We do not know in some instances whether the cases are entirely genuine. There is sometimes an undue inflation of orders.

2155A. They order more than they want because they expect to get less?—They know during drought periods they would get less. They know it is an impossibility during that period to meet all the orders submitted without delay.

2156. We have been told certain people—not the graziers—order ahead a large number of waggons for which they have no sheep?—I have only been in my position since the middle of June last year. During that period I am not aware of any of those orders. I have been told by others that it was the practice occasionally.

2157. That would be orders for trucks which were really not genuine orders, but were designed to enable them to buy cheaply during drought starving sheep, and get in an allotment of trucks in front of the graziers?—Yes. The Commissioners have taken action in that direction which may circumvent anything of that kind in future, inasmuch as they reserve to themselves the right of charging the full freight for all orders accepted and provided where the circumstances are in any way suspicious.

2158. What number of live-stock waggons would tide you over a period of drought?—I would have to take the past figures before I came into the position as a basis. I could give you an idea later.

2159. You would take the number of waggons actually used, and not those ordered?—We would take them both into consideration. I have 1,706 sheep vans and 1,256 cattle waggons. During some of the periods we had as many as 3,000 and 4,000 orders on our books for immediate removal during such periods.

2160. If they are to be of any use they have to be utilised quickly, because the sheep are starving?—Yes. We realise that by placing a large number of wheat waggons into the trade for the relief of cattle and other open empties for the conveyance of sheep.

2161. Are you short of ordinary goods waggons?—No. At the present time I have a considerable surplus.

2162. Having regard to the growth of your business, are you keeping safe with your present amount?—With 300 additional new waggons of 25 tons capacity we are keeping abreast of the times.

2163. How about the growth of business?—We will continue to construct additional waggons. Some of the 300 are ready, and the others are in course of construction.

2163A. You have had some trouble in dealing with grain?—Yes. We find that everybody desires to get rid of their produce as quickly as possible and get it to the seaboard. We cannot undertake to shift the whole of it in a very short period.

2164. There is occasionally trouble at your seaport by reason of the vessels not being there?—Yes. We have had serious congestion at times.

2165. You are short of sheep vans. Would you rather have good waggons built which would be available for general purposes to tide you over a time of drought, or would you prefer to have sheep vans built?—I would prefer sheep vans. The open goods waggons are all right for short distances, but they are unsuitable for a long haul without "spelling" en route. It is hard to say when we will have a drought. Sometimes we experience a drought in the north or west when conditions are favourable in the south, and they are starving on the other sections.

2166. Your drought may synchronise with your movement of wheat?—It is quite probable.

Witness—W. C. Quinton, 31 July, 1924.

2167. You would prefer additional sheep vans than open goods trucks?—Yes. We are constructing both at the present time.

2168. You deal with all traffic reports showing the clearance of traffic during the previous twenty-four hours?—Yes.

2169. Does that apply to the whole of the railways?—Yes. Each depot throughout the State is directed to send me a wire, to reach me at 5 a.m. to show the movement of traffic. That is also dealt with by the Chief Traffic Manager daily at 9.15, and is carefully scrutinised by him. The Chief Mechanical Engineer also attends that meeting, and any matters required to be discussed are dealt with.

2170. The Chief Mechanical Engineer would not be interested in that?—If we have any delays of traffic, and it is a question of engine power, he wants to know all about it. It may not be due to the allocation of engines, but to the running repairs.

2171. You get these reports direct from the stations, and not from the district superintendents?—The district superintendents also receive a copy.

2172. You control the goods engines, which embraces the allotment of goods engines to the various depots?—Yes.

2173. Do you do that in consultation with the Chief Mechanical Engineer?—We confer with him in regard to the actual class of engine that is to be employed. Otherwise we determine what is necessary. We determine the supply of engines daily. We have two reports coming forward, at 9 a.m. and 5 p.m. They indicate the position at all depots throughout the State with regard to engine power.

2174. Are these reports looked at by the Chief Mechanical Engineer as well as yourself at the meeting next morning?—They are.

2175. You keep a record of engines under repairs; where do you get that return from?—From the 9 a.m. and 5 p.m. reports submitted to me by wire from all depots.

2176. Are they from the Traffic Department?—From the Traffic and Locomotive departments.

2177. Sent to you?—Yes. The depot station-master submits a wire, that is from the depot where the locomotives are located. He knows exactly what engines he has on hand. Where repairs are concerned and what they are is obtained from the Locomotive Superintendent, and wired by the station-master. That is also wired to the superintendent of the district.

2178. When engines require substantial repairs and overhaul they are removed, and the depot is recouped when practicable?—Yes. Each engine bears a tabulated number. When that engine is placed into Eveleigh for repairs there is a certain section on our engine board for that number to be placed, and we know that engine is in repair in the locomotive shop. Just a few days before the repairs are completed we are advised when that engine will be available, and we have another space to put that in. We are able to keep an exact check on the movements of all engines.

2179. You are responsible for the engine load tables?—Yes, in conjunction with the Chief Mechanical Engineer.

2180. Those tables are not always governed by the weight of the train?—That is in regard to the capacity of the engine.

2181. Yes?—No. We may have fifty-two vehicles on a train. They may weigh 450 tons, and the engine capacity is 565 tons. The maximum length load of that train is fifty-five vehicles.

2182. Why?—That is covered by the length of various crossing loops and refuge sidings, &c., over which the train has to pass. Instead of taking 450 tons as the capacity of the engine, we take the weight of three vehicles short at 6 tons, making 18 tons. We will say, therefore, 468 tons is the capacity of the engine.

2183. They are very elaborate calculations in regard to some of these loadings?—Undoubtedly, if you were not aware of the circumstances you might think there was

something wrong. That arrangement has been in force ever since I can remember. It has been considered quite in order. If we are within 10 tons of the load we reduce the capacity of the engine. Take a load of 490 tons. The capacity of the engine is 500 tons, and we have not a truck in the yard which will weigh 10 tons, consequently we take 490 tons as the capacity.

2184. You control the tarpaulin factory?—Yes.

2185. Do you control the manufacture of tarpaulins?—No. I have a foreman who is immediately responsible for the supervision of the factory. I am held responsible for seeing proper supplies are maintained and distributed.

2186. Who is responsible for the manufacture?—I am responsible for the proper conduct of the business, and that comes under the heading of manufacturing. My foreman is the man who is immediately responsible to me for the business being properly conducted.

2187. Have you a tarpaulin factory?—Yes.

2188. Are there men employed on your staff?—Yes, and the foreman also.

2189. Do you requisition for the material required?—Yes, through the Comptroller of Stores.

2190. What sort of experience has this man of yours had of the manufacture of tarpaulins?—Twenty years.

2191. You have been manufacturing the whole time?—Yes.

2192. How many tarpaulins have you got?—Our stock is 22,500.

2193. How many do you manufacture or buy a year?—In 1923 we issued 2,997 new tarpaulins.

2194. What do they cost?—Last year's, tarpaulins cost £7 15. The present day cost is £6 16s.

2195. Are you responsible for the use of the tarpaulins on the trucks?—Yes, for the supply of them.

2196. Do you use more than one tarpaulin on a truck?—Yes, in a number of cases. From the Portland Cement Company's siding we use two sheets. Also on trucks of chaff and fodder on particularly long hauls from the southern districts to Wallangarra we use two, which absorbs a great number.

2197. When they are going through interstate?—Not necessarily, but we do always use two. Our business sometimes in that respect is very heavy.

2198. We will put your supply as 3,000 a year, as the wastage of your tarpaulins?—Yes, we have that.

2199. £20,000 a year?—Yes.

2200. You must be using a considerable number of duplicates, or are your tarpaulins too small?—No, one tarpaulin will as a rule cover an ordinary truck of goods. Where truckloads of fodder are concerned we must necessarily use two tarpaulins.

2201. Is that for lashing?—No. The loads are all securely lashed.

2202. Do you sheet your chaff always?—Yes.

2203. Winter and summer?—Yes.

2204. Although they were secured by lashing?—Yes.

2205. Do you get rain here in the middle of summer?—Yes. We are subject to very heavy storms in the middle of summer, and we are never safe.

2206. Sir VINCENT RAVEN: Are you satisfied that your locomotives are sufficiently powerful to take all the goods you have?—I regard them as powerful enough.

2207. There is no need for more powerful engines?—That would have to be governed by the question of draw gear. It is for the Chief Mechanical Engineer to say if he would allow stronger locomotives, on account of the heavy grades we have to travel over.

2208. As far as you are concerned you are taking loads which are necessary?—Yes.

2209. Those loads, as arranged, appear to be very complicated. I do not know if you would consider the line from Sydney to Goulburn as illustrating the character of the line generally in New South Wales?—No. That is somewhat easier. Our western and northern areas are much heavier as regards grade than the south.

2210. It has gradients of 1 in 40?—On certain sections, but not to such an extent as on the north and west.

2211. The loads vary considerably with the different classes of engine and the different classes of trains, and with the length load of the carriages?—Yes. On some sections we work up to sixty vehicles, others we will run seventy. That is entirely governed by the facilities available for crossing and refuelling.

2212. It appears from this statement that you never get a load up to the capacity of the locomotive?—There would be instances where the exact tonnage hauled does equal the capacity of the engine, but there are many where we are from 3 to 10 tons short of the capacity.

2213. I have a paper here giving the capacity of the engine and the fixed load, which I understand to mean the load allowed?—Yes.

2213A. And the gross load taken. In very few cases, if any, have you come up to the load which the engine could take. In a number of cases you have come up to the fixed load, but the fixed load appears, for one reason or another, to be considerably below the load which the engine can take. Do you agree with that?—Each train is dealt with on its merits. The loading is carefully analysed to ascertain if better could be done. No doubt there are a large number of differences between the gross and the fixed load. I feel satisfied the system is quite all right.

2213B. Looking at the table which I hand you, the red line indicates the capacity of the locomotives, and the next line indicates the fixed load. You see the differences?—Yes, there are differences. Take the second item. We only got up to 360 tons. Our engine capacity is 565 tons. That is a fast goods train with a limited length. It only conveys 45 vehicles.

2213C. That is not isolated?—There are a number of cases in the same category. No. 25 has 53 instead of 55. The gross tonnage of the 53 vehicles is 542 tons. We take to debit 6 tons each, 12 tons for two vehicles short, making 554 tons.

2213D. If that statement is correct, it looks as if the engine were amply powerful enough to deal with the necessary trade?—Yes, I feel satisfied on that point.

2213E. Does that illustrate generally what takes place?—Yes, that may be taken as an index. The idea of the loading returns is to detect whether there is any undue wastage of engine power.

2213F. Do you find you get many failures with the locomotives?—Yes, a considerable number.

2213G. That is not due to the load?—No. The Chief Mechanical Engineer takes care that he does not allow the engine to become overloaded.

2213H. How can he tell that;—he has nothing to do with the engines when they get outside?—Only as far as the engine load table is concerned; it is up to us to see that the engines are not overloaded as compared with the fixed load.

2213I. He cannot tell if it is overloaded after it gets on to the road?—The locomotive people would not know unless an engine stalled on account of being overloaded.

2213J. In connection with waggons, you have a number of different classes?—Yes.

2213K. It is an advantage, is it not, to reduce those classes to a minimum?—They are being gradually reduced. That is to say, the standard 25-ton waggon is gradually being adopted.

2213L. Are you endeavouring to bring them down to a fewer number of classes?—Yes.

2213M. So far as the workings of the engines are concerned, after they leave the shed it is of great importance to the Chief Mechanical Engineer that the best work should be got out of them, because a good many of his costs are got out on the train-mileage basis?—Yes.

2213N. How is he able to take part in that?—He will obtain the same information as I do, the information prepared by the Director of the Statistical Bureau, indicating the miles per hour.

2213O. He only knows afterwards?—As far as I am aware.

2213P. If the organisation does not allow him to take part in the arrangements of the working he cannot know?—He has no control of the engine after it leaves the shed.

2213Q. Can you suggest how he should know before if that is so?—No, I cannot suggest how he could know before.

2213R. He can only take up the matter after it comes under his notice by some returns?—Quite so.

2213S. Does he often take up cases?—I am not aware of what he does. He does not come to me.

2213T. Who would he make the complaint to?—Principally to the Commissioners. There is no connection between the Chief Mechanical Engineer and myself, in those subjects. I am responsible for the miles performed by the engine.

2214. Then it would come to you eventually, even although he took it up first of all through somebody else?—He has a representative attending the Assistant District Superintendents' conference, at which I preside once monthly.

2215. It would come to you eventually. If he had a complaint he does not take it up directly with you?—That is so.

2216. No matter whom he takes it up with, it would eventually come to you for explanation?—Yes, I would see to that. There may be cases out in the various districts which I would not see. There may be some unsatisfactory local working in a particular district, and his representative may take it up immediately with the traffic representative, the District Superintendent. I would not know anything about that probably at the time.

2217. If it was a complaint that you were responsible for, would it not come to you at some time?—Not necessarily, unless it is a particularly serious case.

2218. So far as you know, the Locomotive Superintendent has not taken up any cases?—You are referring to the Chief Mechanical Engineer?

2219. Yes?—Not with me. There are cases where an engine has been delayed which the Chief Mechanical Engineer has taken up with me. If there are cases where the locomotive inspectors consider undue delay has occurred they will represent that to the District Superintendent.

2220. Who fixes the length of the load—the Chief Mechanical Engineer?—In some instances the Traffic Department determines it, if it is the case of the length of refuge siding or crossing loops. If it is a question of drawgear and we can take more than fifty-five or sixty, then the Chief Mechanical Engineer will approve, say, up to seventy.

2221. Sir SAM FAY: The line from Sydney to Goulburn is one of your chief lines?—Yes.

2222. What particular part of it is responsible for limiting your load in length?—The 1 in 75 grade from Picton to Moss Vale.

2223. You gave the reason the limitation was due to your refuge sidings, crossing places, and so on?—Yes, because we can otherwise take sixty vehicles on the Goulburn section.

2224. You gave the case of forty-five waggons being the limit?—That was a fast train due to speed only.

2225. Are you limited in any way between Sydney and Goulburn to fifty-five?—We can convey sixty, except at certain times, when mail trains are concerned, and there are certain places where we cannot accommodate the length of trains. We have difficulty in taking fifty-five out of Enfield. From Enfield at the present time we do not usually send more than fifty-five vehicles.

2226. That is from Enfield?—Yes.

2227. Why?—In setting back on to our departure road we have not the sixty vehicles length available.

2228. In consequence of your not having more than that particular length in your siding at Enfield you limit the load from Sydney to Goulburn, 149 miles?—It would not

Witnesses—W. C. Quinton 31 July, and N. W. Kater, 1 August, 1924.

affect it to any great extent. Almost all trains convey the fifty-five on account of the restricted facilities on the road in regard to refuge sidings.

2229. Have you no practice of shunting across?—We have a double line, but I do not consider that advisable except in cases of emergency. It is done.

2230. Is that because of the steep grade?—In some instances.

2231. As a matter of fact, you are limiting your load to some extent to trains going away from Sydney because of the length of your siding in Sydney?—Yes.

2232. Sir VINCENT RAVEN: Have you any knowledge of the train miles per hour which you get out of your train?—Yes.

2233. You have a record of that?—Yes.

2234. You keep information which gives you the train miles per hour?—Yes, every district is concerned. If there is any falling off I want to know why.

2235. Do you send that anywhere?—Yes. That is prepared by the Director of the Statistical Bureau, and each District Superintendent receives his copy.

#### FOURTEENTH DAY

FRIDAY, 1 AUGUST, 1924.

(Held at Chief Secretary's Building, Macquarie-street, Sydney.)

#### COMMISSIONERS:

Sir SAM FAY.

Sir VINCENT L. RAVEN.

Hon. Dr. NORMAN WILLIAM KATER, M.L.C., President Graziers' Association of New South Wales, sworn, examined, deposed:—

2236. Sir SAM FAY: We have your list of submissions?—I am going to deal with Nos. 7 to 11. In what I am handing in there is a question I asked in the House about drunkenness in the service.

2237. Take No. 7—methods of railway construction. You suggest the method should be reviewed?—Yes. I cannot give very much specific evidence of waste in the system, but there is a general impression that the present system of railway construction is extremely wasteful. Some of the railways which have been built have taken years to build, and the estimates have been very much exceeded. Take the Dubbo-Werris Creek railway, for instance. That took ten years to build. A lot of the capital was locked up during the process of building. The cause of that is the Public Works Committee submitting to Parliament recommendations for railways to be built all over the country, many of which will never be built. Parliament decides to start a certain job, we will say, without being certain that they have the money to do so. When it is half finished certain political exigencies make them start a job elsewhere. Men are removed to that. In that way there is an enormous loss. It is believed that the work done by the Railway Construction Department—there is not fair value obtained from the employees for that work. For instance, there is the siding I had constructed by the Railway Department on my own property. I got an estimate from the Railway Department. Incidentally they made me sign an extremely one-sided agreement under which they could tear it up at any time at my expense. My solicitor told me I would have to accept it if I wanted the work done. The estimate was for a certain sum, with the proviso if I constructed the earth works it would be reduced by £150. I accepted that and got in touch with a contractor. I asked him what he would do the earth work for, assuming that it was a certain measurement. He said £50. I found afterwards the plans they had given me did not show there was a down-grade. It was a dead-end siding. Consequently we had over-estimated the amount. When we came to do it we found we did it for under £25, and they estimated it would cost £150. That is a small example of what their estimates are. If they estimate the earth works cost six times what it does, possibly the estimate of the rest of work is six times the cost also.

2238. In the first instance, on our arrival here, we called for all the minutes of the various conferences held by the

railway officials for twelve months. We found on the engineering construction side very considerable evidence of the waste which had been going on, apparently for a series of years, in the construction of lines, brought about more particularly by what you say in the shape of not being able to find the money or the men being transferred to another job. It meant perhaps double the cost. That is not a reflection on the railway officials—it is a reflection on the system of finance. That is a matter to which we have given a great deal of attention. In regard to the actual estimates and the actual costs following on the estimates we have had some evidence from the Engineering Branch, and we will follow it up again. Apparently they are satisfied that day labour is the best plan?—I do not agree with that.

2239. It is a question of supervision more than anything else?—Yes.

2240. Sir VINCENT RAVEN: Do you suggest that this new construction work should be let out on contract?—I do. You then have a time limit, and the Government would be obliged to find the money.

2241. And there would be a check on the Government's estimates?—Yes.

2242. If the contractor could do the work cheaper than the Government it should be let out on contract?—Yes.

2243. They have to find the money and carry it through once they start?—That is an advantage to the country. It would be an advantage even if a contract cost a little more than the present system. For instance, the Dubbo-Werris Creek railway might have been built within two years, and it would then have cost less than in the long run what it did, even if the initial cost had been a little more, because all that money had been lying idle all those years.

2244. Sir SAM FAY: It would mean in times of financial stress these works would not be commenced, which would be an advantage?—Yes.

2245. Sir VINCENT RAVEN: You consider that when works are commenced they should be completed quickly?—They should be carried through with the quickest possible despatch.

2246. Sir SAM FAY: Take No. 8, that the present Railway Appeal Board be reconstituted?—It appears from the constitution of that board that it is possible they may not always give an impartial verdict. I produced a question with regard to that which I asked in the Upper House.

2247. We have been struck by the number of disciplinary cases which have come before the Commissioners which are noted in the conference minutes. The number appealed against and varied by the board does not appear to be very great in comparison with the total. There are more cases than we have been used to?—I would be very sorry to be at the head of a service in which the discipline was subject to an appeal board of that nature. It tends to undermine the discipline of the service.

2248. As a matter of fact, the decision of the Chief Commissioner cannot be appealed against?—I think that is true. I do not think he often exercises it.

2249. He feels he would be going against public policy as expressed by the Act?—Yes.

2250. Therefore any disciplinary measure taken is taken by the officer in charge of the department?—Yes.

2251. You think that some alteration should be made in that appeal board?—It should be done, or its personnel altered so as to give the Commissioner a larger say in it.

2252. Sir VINCENT RAVEN: Is it composed of men who have had experience in labour troubles and government of men?—I could not say. The outside member is a stipendiary magistrate. He is there in a judicial capacity. The other members are both employees in the service.

2253. It is difficult to manage a large undertaking like a railway company if the authority to deal with your men is taken out of your hands?—Naturally.

2254. Sir SAM FAY: Then there is No. 9?—A great advance has been made. A considerable increase in speed in stock trains has been given. We still think it might be increased, and that some of the delays at various places might be decreased. Certainly we think they should be given precedence over all other goods trains.

2254A. The stock trains you refer to are stock trains to the market here?—To a great extent. Stock trains moving starving stock are just as important.

2255. Then with regard to the supply?—Supply is a very serious thing in drought time. We often have to wait six weeks to two months for trucks to move our starving stock. That puts you in a difficult position. The preliminary process to moving your sheep is to lease portion of a property. You are obliged to take it from the day of inspection. The lessor will not wait two months to lease it to you. In spite of that you may have to wait two months for your trucks. In the meantime perhaps rain has fallen, and you do not need the country, or half the sheep may be dead. The long delay experienced in waiting for trucks causes enormous losses.

2256. It is admitted by the Commissioners they are short?—Yes.

2257. We have been considering what would be the best thing to recommend. We have put it to them that it might be better to construct goods trucks which would be available for removal of stock and other general purposes. The evidence we have is rather against that. They would prefer sheep trucks, which means if you have an adequate number to deal with times of drought for perhaps nine months of the year those trucks would be idle. Have you any views to offer as to whether it would be possible to have a dual truck?—I have used ordinary D trucks in the transit of sheep. I do not like them. That is an open truck without a top on it. Sheep travel fairly well in them. The floors get very slippery, and the sheep get down. I am against them for the long journey. The only losses of sheep I have had have been from travelling in them and getting drenched with rain.

2258. If a temporary top could be put on?—It would be much better than at present, provided ventilation could be effected.

2259. Or a truck with a permanent top and a movable top floor?—Yes. It is certainly a thing well worth investigation.

2260. At present there are sufficient open trucks, but insufficient cattle and sheep trucks?—Yes, insufficient cattle

and sheep trucks, and often a shortage of open trucks as well.

2261. Sir VINCENT RAVEN: Has a combination truck ever been proposed?—Not to my knowledge.

2262. It has not been proposed and objected to by the graziers?—No. We have a lot of evidence from the agents which I will hand in with regard to delay. Before leaving the question of trucks, I would like to say about the construction of sheep vans. An enormous waste of money has been incurred through faulty construction of them. The first truck used had solid top floor and bottom grated. That used to get dirty and the sheep get down. The design was altered. For the top floor they instituted a grating. They made a roof below that with a space of several inches for the lower deck. It was a curved roof. They made all the roofs of tongued and grooved boards. It should have been obvious that if the space was not kept clean there would be a good deal of rotting dung between the two spaces, and the moisture and heat would quickly destroy the roof. That happened. The boards buckled and they leaked like sieves. Only the other day I asked for sound trucks. They supplied me with one with a leaking roof. I think someone is to blame for not foreseeing that. They have altered it now. They are still using the same grooved timber, but they are putting a galvanised-iron sheet underneath, and a layer of bitumen between the two. They have had to tear all those roofs out and replace them, which is a great expense.

2263. Did that go on for any length of time?—I do not think they found it out till I drew attention to it. They did not start to alter it till I discovered it for them.

2264. That is recently?—Three or four years ago.

2265. These trucks for a special purpose—is a design submitted to the graziers?—Lately it has been—the new truck. We were asked to see it. They used not to do that, but in the last year or so they have been doing it.

2266. You realise the importance from the economy point of view of reducing the different types of truck as much as possible; is there one truck you could agree to?—So far as the general design is concerned, I am not talking of the roofs. We are satisfied with the latest type.

2267. You would be satisfied in future if they submitted a design for your approval?—Yes. We want them all of one type. If you are trucking twenty trucks of sheep and you have to bring your sheep 20 or 30 miles under the present circumstances you do not know within 200 sheep how many to take. There are two trucks, the large and the small. The large trucks hold ten more than the small ones.

2268. Would you prefer the larger truck?—Yes.

2269. I suppose there are no other trucks you would like to refer to besides those carrying sheep?—No.

2270. Sir SAM FAY: You would like to refer to the carriage of fodder for the use of live-stock?—Yes. During drought periods one can get fodder carried at a reduced rate. We have recently asked the Commissioner, why not move that fodder to those of us who are provident and move it in good times, if we sign a declaration it is to be stored on the property for sheep fodder only; why not move it in times of plenty instead of waiting till times of drought? One of the difficulties in times of drought is that you cannot get trucks for your fodder. I have several letters as to that I will hand in. The manager of the New Zealand Land Company tells me that they grow a lot of fodder themselves on one property. When they try to move it to their other property in drought time they cannot do it on account of the shortage of ordinary trucks. It would be no loss to the railway if they will carry this fodder at a reduced rate in times of plenty. It would be an advantage to them; because they may have a certain number of trucks idle then.

2271. We have seen ricks of lucerne at various places; that is what you refer to?—Principally, yes.

2272. Would the conveyance of fodder as a rule be at the same time as the movement of wheat?—It is hard to

Witnesses—N. W. Kater and H. V. C. Thorby, 1 August, 1924.

say. We are prepared to buy fodder at any time at a moderate cost. The movement of wheat is November to March. I should say we would wish to move the fodder at any time during the year.

2273. I was wondering whether it would suit your purpose if this took place at particular times when they were not pressed for trucks?—To a certain extent. It would be subject to this disadvantage: if it were known that the Commissioners were going to move the fodder only during those times the agents and sellers of fodder would hold up their produce till those months, and perhaps we would have to pay more.

2274. Sir VINCENT RAVEN: Your point is that it should be moved at a definite time, when there are plenty of trucks at the lower rate, which they charge in drough times?—Yes, provided they are guarded by statutory declarations that it is to be stored on a property and not for sale and to be used for fodder for sheep. It would be an advantage to both parties.

2275. WITNESS: There is the question of cross-country line, No. 5. There is an urgent necessity for cross-country lines. It has been found the Dubbo-Werris Creek was of enormous advantage in moving fodder and sheep. We have always urged, and we urge now that more cross-country connections be made between the various systems. I have some matter relating to that which I will hand in.

2276. Sir SAM FAY: Do you refer more particularly to lines crossing east and west?—Some would be north and south. I give the Dubbo-Werris Creek one as an example, and the Forbes-Stockinbingal.

2277. Sir VINCENT RAVEN: Would they be light railways for the carriage of stock and not passengers?—I am not competent to answer that. In one way light railways are a mistake, because if the country is opened up you may want a permanent heavy railway.

2278. Sir SAM FAY: I suppose the Dubbo-Molong line would be an example of it?—Not to a very great extent, because that really is a loop of the main line.

2279. To avoid the heavy gradients?—Yes. That is a direction the line should have gone in the first instance, and would have gone if our railways had been in private hands. It was a shame the railway was ever pushed on from Orange to Wellington through the wretched country it goes through, when it could have gone via Molong through excellent country.

2280. Having in view the difficulty there has been in raising money for these lines, have you any views in regard to the taxation of lands by a contribution of a small sum per acre per annum for a number of years where it is obvious that the lands are improved in value?—We are so heavily hit now by the Federal land-tax that I would hesitate to answer that. The Federal land-tax is very heavy.

2281. Would the improvement of land value extend to a distance of 20 miles or 10 miles from a new railway?—I would say 20 miles. It used to be considered 16 miles was the limit you could cart wheat to the railway. And from the wheat point of view I would say it would increase the value up to 16 miles.

2282. It would be a very small sum per acre per annum spread over a number of years which would be necessary to meet the capitalisation of the railway?—It might be a sound idea.

2283. We have been looking at the financial difficulties and they are great?—I do not say it is not a sound idea. On the spur of the moment I would rather not express a definite opinion.

2284. It is more a question of policy than anything else probably?—Yes. With regard to railway finance. I think it might be as well to separate the railway system from the State Budget and allow them to raise their own loans.

(Witness retired.)

HAROLD VICTOR CAMPBELL THORBY, M.L.A.,  
President, Farmers' and Settlers' Association of New South Wales, sworn, examined, deposed:—

2285. To Sir SAM FAY: I propose to deal with most of the items. Mr. Kidd will deal with No. 4. I would like to point out under the heading of No. 1, we submit the suggestion that the railway administration in New South Wales has arrived at such a stage when we would like you to consider whether it would be advisable to divide the administration into four sections, the northern system and branches, the western system and branches, the southern system and branches, each of which constitute a separate system, and the metropolitan area, which would constitute another division. I have the reasons tabulated, which I will hand in. Under the present state of affairs the railway administration is becoming unwieldy, more particularly when you recognise that the tram systems of Broken Hill, Newcastle, and Sydney also come under the control of the same organisation. We ask you to consider whether it is advisable to place the railways and tramways under separate control. The railway and tramway systems are growing to such large dimensions and are so widely scattered that the time is at hand when the traffic problems of Sydney alone call for the undivided attention of one having full control and responsibility, to enable that individual to concentrate upon the future development which will be necessary to meet the transport requirements in the near future. That is a view I hold of the separation of the tramway from the railway administration. It will be necessary for the tramway authorities to undertake a motor transport sub-department of the tramway, to keep up with the growing needs of the people of Sydney. That would bring about further complications in our Railway Department if it were left under the one control. It is also pointed out in this statement that Sydney, Newcastle and Broken Hill each have their traffic problems, which are matters to be considered in conjunction with the municipal authorities more than any other section. The municipal authorities are directly concerned with tramway administration; and the producing and industrial organisations are more directly concerned and interested in the administration of the railways. We feel we could get better administration if we had an organisation or an administration which would concentrate upon the railway development itself, and keep more closely in touch with the requirements of the producing and commercial interests, and leave the administration of the tramways and so forth to an independent Board of Control. To do this we suggest the railway system of New South Wales should be divided into four divisions, each division to have a sub-Commissioner with full control and responsibility of his own division. I particularly emphasise the varying conditions. In New South Wales you have the north and the sub-tropical areas, where the conditions are entirely different from the south and the west. Each of our railway systems deals with a distinct type of country, and industries. We cannot stress too much upon the efficiency of our railway administration. We should have a better system, which will encourage the development of the national resources, particularly the primary industries, to the greatest possible extent. If each system or division was placed under the control of a Sub-commissioner, then it would give us decentralisation of administration, cheaper and more efficient control and throw the responsibility more directly on those who would be more closely in touch with the requirements of each division, with a Chief Commissioner to act as general manager of the business. With the opening up of new ports, Coff's Harbour and Clarence River on the North Coast, and Port Kembla on the South Coast, the completion of the North Coast railway and the construction of the line from Moss Vale, which is sanctioned, and at the same time the linking up of the Victorian and Queensland lines increased development will be encouraged, and

will greatly increase the railway work of the State in the near future. With the completion of cross-country connections, a great proportion of the railway traffic will be carried on without coming within the influence of Sydney. That is illustrated by the completion of the Dubbo-Werris Creek line, where, within the first three months, over 111,000 tons of produce went across. That shows the demand was there, waiting for the completion of the cross-country connection. With the exception of these lines, a tremendous amount of the transport between the various districts will go on without coming within 250 miles of Sydney. The completion of the City railway also tends to overload the central control, and the outlying interests are liable to be overlooked. I would like you to give full consideration to that. With the completion of the underground city railway and the electrification of the metropolitan railways, and with concentration of the administration in the city of Sydney, our contention is that that liability exists—the overlooking of the interests of the outlying districts. More sympathetic consideration is given to the requirements of that particular area which comes more particularly under the notice of the controlling officers than those portions far removed from headquarters.

2286. To Sir VINCENT RAVEN: I have dealt with No. 1 and No. 2 combined. Reading from my statement, I strongly urge that if sub-Commissioners were decided upon then that they should meet in conference at least twice a year with representatives of the various industries and interests to discuss all matters of importance to the respective industries and the railways, that it would be possible to have the various organisations working more in co-operation than at present. The producers' organisation has always been anxious to meet the Railway authorities and where possible offer suggestions which may help them. The Railway Commissioners can offer suggestions which will assist us to co-operate in the trucking of our products. I contend that it would have the effect of creating a spirit of competition between the different divisions and give greater scope to ambition than at present and individual initiative. It would establish a headquarters staff right in the centre of the division under their control; it would prevent overloading of any individual and eliminate delays and congestion. The Chief Commissioner and his central staff would still be the supreme authority on matters of policy. My opinion is that to spread one working organisation over the entire railway system of New South Wales gives heads of departments too wide a field of operation, for anything like careful attention to details, and makes necessary their dependence upon subordinates who are far removed from their immediate oversight, while the idea of separate and distinct units of management on the other hand confines heads of department to smaller fields and makes them directly responsible to a local head or sub-Commissioner who has general charge of the service within his division. It is essential in such a large organisation as our railways that the responsible head be relieved of detail; or much of his time would be taken up with minor matters and travelling over the extensive lines of the State. Or the greater part of his time and attention may be given to one division, particularly that which comes most directly under his notice and attention to the detriment of that which is farthest from his observation or control. That is what we fear is going on at the present time. Those portions of our railway furthest removed from the headquarters are most neglected. We contend if we can get a system of control different to our District Superintendents it will improve the administration. That would improve the whole working conditions of the railways. To prevent this, I contend that subdivision is essential with the responsibility carefully apportioned and placed under thoroughly competent men, who would obviate the necessity of referring anything but the most important questions of policy to the Chief, working out all their own divisional problems in accordance with instructions laid down by general policy. All divisions to be worked in

close co-operation with each other yet retain its distinct management. The trouble is, no matter how small or unimportant a matter may be at the present time, practically everything has to come through headquarters, and all their replies come to head-quarters before any little alteration or any small country work can be undertaken or any repairs effected. That causes delay. Our ambition is to overcome that and bring the controlling authorities more closely in touch with the producers and the country people who use those lines and pay the bulk of the freight.

2287. Sir SAM FAY: Have you done with the suggestion there should be decentralisation of control?—I was not referring to the financing of the railways at this juncture.

2288. Do you attach any importance to four divisions as against three?—No.

2289. Would it not be sufficient if decentralisation took the form of a northern division under an efficient commissioner stationed, say, at Newcastle, another for the western, and another for the southern, the southern man being assisted. Do you see any objection to the southern man at Sydney?—No. That would meet with our views. We merely refer to the three country divisions and the metropolitan divisions, because the three systems are so distinct. The southern man probably could control the metropolitan division.

2290. If you have another division for the suburbs of Sydney and Sydney, you would not then have the traffic from, say, the south in one hand. You would have it in two hands. You would be taking it from the jurisdiction of your southern superintendent and handing it over to your metropolitan superintendent. Would that not be some disadvantage?—Whoever was commissioner of the metropolitan area would be chief commissioner, and he would be supervising the receiving and despatching from his assistant commissioners, north, south, and west. The chief commissioner would have the central organisation, which would have control over that. Those are merely suggestions to give us something better than we have at the present.

2291. Your idea of the duties of the area commissioners would be operation and commercial?—Yes.

2292. Having under them assistant engineers under the chief engineer?—Yes.

2293. And likewise the mechanical side under the Chief Mechanical Engineer?—Yes.

2294. Is not your view there should be a complete organisation from an engineering point of view in each district?—No, I suggest the same subdivision should take place as far as the engineering is concerned. That should be separated as far as practicable, and, as far as possible from the sub-commissioners' control, and throw more responsibility on the Chief Mechanical Engineer than what is thrown on him at present. He has practically no power as far as the staff is concerned at present. If he is to get the best out of his organisation he should have more power and have absolute control of the Engineering Department, and be responsible for the out-turn therefrom, machinery, locomotives, and repairs. Is it not advisable new construction should be kept as distinct as possible from repair work?—I have a statement from the senior engineers in the Eveleigh works, where they complain of the fact that new work was brought in and congesting the work to such an extent that the repair work could not be carried out.

2295. Sir VINCENT RAVEN: Is the Chief Mechanical Engineer not entirely responsible to the Chief Commissioner for everything which goes on in the department?—He is responsible to the Chief Commissioner. He has not complete control over that department, not even over the staff.

2296. If he has responsibility as the head to the Chief Commissioner, and the Chief Commissioner alone, can he not do exactly as he desires in his own department?—I think you will find that he has no administrative authority except everything which is authorised by the Commissioners.

Witness—H. V. C. Thorby, 1 August, 1924.

2297. In his own department he has complete authority?—On the evidence I have everything has to be referred back to the Commissioners. He is the designing engineer, but not the administrator, so far as the works are concerned.

2298. Is your opinion that he has not complete control over his men and over the works?—Yes. That is what I have gathered from interviews from Mr. Lucy and documents I have perused.

2299. That the Chief Commissioner interferes in his detail department work?—It is practically controlled from the Commissioner's office, not the Chief Mechanical Engineer's office.

2300. The control of his workshop or as to what he should build?—As to what he should build, and the discharge or employment of men. That does not go through the Chief Mechanical Engineer. He has very little to say in connection with his work. If they do not give satisfaction he reports the matter.

2301. He deals with the punishment of his men?—It does not appear so in referring to various Royal Commissions.

2302. No doubt he would have to submit to the Chief Commissioner the money which he expects to expend in the shops, and the class of new engines and rolling stock which he is going to build. Outside that do you say he has not complete control?—I say that he has not complete control of the engineering department.

2303. Can you give us any reason why you say that. My information is entirely opposite?—I produce the evidence before the Select Committee of inquiry into the case of Mr. Dingle, dated 19th December, 1923.

Can you remember the report?—Not in detail. Did you speak to the Chief Commissioner about the report?—Yes. Everything in that nature was referred back to the Chief Commissioner.

2304. It is obvious that Mr. Lucy is under the Chief Commissioner?—Yes.

2305. And it is obvious the Chief Commissioner can give him instructions if he desires. He has not complete control of his own department and everything which goes on in his own department, you say. I should like to hear about that. That does not show he has not complete control over his own department. With regard to Mr. Brain, the Electrical Engineer, would you say the same?—He has more control than Mr. Lucy has in the Railway Department. When the 1917 strike took place Mr. Fraser, as far as the railway was concerned, practically dealt with the matter himself, as I can show from the speeches he gave at Eveleigh Works. In the tramways works Mr. Brain took more of a direct hand.

2306. Sir SAM FAY: There is a good deal of evidence in connection with that inquiry on the general administration of the railways?—Yes.

2307. Going back to the question of the division of the tramway system from the railways, what particular advantage do you think would be gained. There are obvious disadvantages. There are certain manufactured articles which are common to both?—Our contention is under a costing system that would not make any difference. They would be charged up to whichever department they were supplied.

2308. You mean that the railway shops supply the separate organisation, such as the tramways?—Yes. If the Chief Commissioner still maintains control of all those organisations there would be no objection to it so long as each organisation was placed on its own merits, and we had detailed reports in connection with the finance and manufacture of those various organisations. I feel there is a certain amount of confusion in connection with the costings of the various departments. Reports submitted to Parliament in answer to questions are not explicit or satisfactory, and in many cases are not correct.

2309. Sir VINCENT RAVEN: Do you suggest the tramways and railways are not separate in the same way as you propose?—They are partly separate. The tramways are under Mr. Doran, and the Railway Mechanical Department under Mr. Lucy, the Electrical Department under

Mr. Brain. If they are more completely separated both as regards finance and everything else, they would be more satisfactory. The surplus revenue from the Tramway Department is paid into the general balance-sheet of the Railway and Tramway Commissioners, and it is a set-off against any loss in the Railway Department, and vice versa. The Tramway Department this year will probably show a loss.

2310. Sir SAM FAY: Is there any disadvantage in that?—The trouble is, the people who use the tramways have a greater influence on the administration, for whatever cause it may be, than the people vitally concerned in the railway administration. If we could get the railway administration more closely in touch with the country interests and the industries they serve we would probably get more sympathetic consideration.

2311. Sir VINCENT RAVEN: The point you were speaking of, to begin with, was the question of entirely separating the two accounts?—Yes.

2312. All the accounts which were debitable to the tramways are debited to the tramway, and to the railways also. There is a separate balance-sheet, which is shown in the Commissioners' report. That is done to-day. As to how you shall deal with the final result is another matter.

2313. Sir SAM FAY: I should say so too. I do not see where you gain anything from a financial point of view or working point of view from dividing it?—In the near future it is contemplated that, through the entry of the motor buses, complications are going to arise between the private buses and the tramways. Suggestions have been put forward that the tramways should be taken out of the main streets. The underground railway is going to bring about an alteration. They are factors which should be dealt with more closely between the municipal authorities and the controlling body of the tramways. Every other capital city of the Commonwealth, except in Western Australia, has separate Tramway Boards, running independently of the Railway Commissioners. They borrow their money and administer their own affairs.

2314. Whether it be tramways or motors on the road, it is all a question of transport?—Yes.

2315. The principles of transport do not vary very much, if at all. Whatever the method may be of conveying people from place to place, the principles remain constant. If you look anywhere in the world you will find big organisations running not only railways, but steamships and all sorts of things successfully. That applies in America, where all sorts of methods of transportation are under one hat, and to advantage. We have some evidence from Sir Mark Sheldon in connection with it. We have not been pointed out what real advantage there would be in dividing the two, assuming that the real operating officer of the tramways was more or less independent, that he would have nothing else to do but look after the tramways under the authority of the Railway Commissioner. We should like you, if you could, to give us some indication of any real advantage there would be in separating them?—You realise that at the present time political influence has a great deal to do with tramways and railways administration. All the money voted to the railways or tramways is voted through Parliament, and the same Public Works Committee, which investigates new tramway lines, is the same Public Works Committee which investigates railway proposals. Money is voted for certain works to be carried out, and then political influence causes that money to be diverted from a railway to a tramway, and vice versa. Works which have been sanctioned are hung up. Employment is found for large numbers of men through political pressure. Under one Administration it is placed, to my mind, in a difficult position when they have the handling of the one lot of funds, and political pressure induces them to divert those funds and shift the men.

2316. Do you think that would be altered under any system of division? Could not Parliament do what it liked with either one or the other?—Undoubtedly they do,

2317. Sir VINCENT RAVEN: Under your proposal to have these divisional areas, with a Commissioner over each, such Commissioner would be over the tramways and railways as well, I take it?—I am not sticking for that point. The suggestion we make is, would it not be advisable to have these subdivisions and have a distinct Tramway Commissioner, and, if you thought it advisable that the Chief Railway Commissioner should be supreme, well and good.

2318. What I wanted to know was whether these area Commissioners would be over the railways and the tramways as well, under your proposal?—No, that is not my idea; my idea is a separate tramway Commissioner—a Sub-commissioner.

2319. I refer to your first point, that the State should be divided into different areas, so that each area might receive a very special consideration?—There are no tramways in other areas.

2320. There is Newcastle, and at some future time I gather that the tramway systems will be extended?—No doubt.

2321. And to that extent, the Commissioner who had that particular area would have both tramways and railways under him?—That was not my idea. In Victoria, in such places as Bendigo and Ballarat, they have their separate Tramway Board and separate tramways, and when they feel competent to start a tramway, they do so, and that is their liability.

2322. And you suggest there should be separate Tramway Commissioners as well?—Yes, that is my view, but if you thought after consideration that a Chief Commissioner over the whole would be a better policy, we would not find fault with that.

2323. In the meantime, all that we want to know is, what your suggestions are?—That is the suggestion we put forward, namely, that the tramways should be separated from the railways, and that the railways be divided into three or four sections, each under the control of a Sub-commissioner, the Chief Commissioner controlling the whole lot.

2324. Sir SAM FAY: We have to look at it, more particularly for the purposes of our report, from the point of view of economical working. It does not appear to us, from the evidence so far before us, that any division of tramways from railways would lead to economy—rather the contrary?—That is not our view; still, we are not experts, and merely put these suggestions forward for your consideration.

2325. Sir VINCENT RAVEN: All the questions of finance are separated to-day?—Yes. Of course, I have seen the Eveleigh Works congested with railway work that was very badly needed in the country districts in the way of repairs. I have seen that hung up on account of work going on on the Newcastle steam traction boilers. I admit that all that would be a charge to the tramways.

2326. Sir SAM FAY: What is the next point you deal with?—The next is that, in the case of developmental lines which are not yet paying, the Railway Department should be credited with some of the benefit which the Lands Department is at present absorbing on account of the increased rentals which are being received from the Crown lands as the result of the railway lines passing through them. The idea which the Farmers and Settlers' Association has held for years is that the Railway Department should not be held responsible for losses incurred on developmental railways. Lines are sanctioned by Parliament and constructed, for developmental purposes, to open up the country. They are then handed over to the Railway Department and are referred to as non-paying lines, and they have a tendency to increase the freights and fares on all other sections of the railways, that being the natural ultimate result. Our contention is that the consolidated revenue should stand the loss on developmental lines, in the national interest.

2327. Entirely through the Lands Department, do you mean?—No, not through the Lands Department. Our contention is that it should come from consolidated revenue.

The Lands Department controls both the Lands and Forestry Departments, and they are the two departments which most benefit from the construction of a railway line—*e.g.*, in the case of the Dorrigo line, the Forestry Department are reaping a rich harvest from the various areas surrounding the Dorrigo line, but the Railway Department should get some credit for having to run that railway probably at a loss.

2328. In arriving at the actual loss on any railway, would you give any credit to that new railway from traffic brought upon the main line?—Yes, I would, but I do not think, from the discussions I have had with the Secretary for Railways, that the present revenue returns on a certain branch line gives that line full credit for the traffic which it brings to the line or attracts over the main line from the capital.

2329. Our evidence is, so far, that no credit is given at the present time?—No, but my view is that there should be credit given to that line. Another point in connection with that is this, that the Railway Commissioners adopt the practice when they take over a light line, say, of 60 lb. or 70 lb. rails, that they gradually convert that line if necessary, into 80 lb. or 90 lb. rails, and charge that to repairs or betterment; still, it means that the revenue of the railway is being taxed or that the users of the railway are being taxed to convert a light line into a heavy line, whereas that should be provided for out of the capital cost originally.

2330. Does that mean that you suggest that no light lines should be built?—Well, I do not approve of light lines except in very exceptional cases. We have a glaring instance of the failure of light lines in the Dubbo-Werris Creek line. It has only been opened six months, and it is now generally admitted that the rails on that line will have to be converted from 70 to 80 or 90 lb. rails. During the wet season last Christmas they ran heavy engines across that line, and they bent the rails down and destroyed the formation. Consequently, they had to take those heavy engines off and put the lightest (A class) engines on that line, to take small loads across. That meant a good deal of delay. At the same time, the heavy engines are not able to put up the speed on the light lines that they would be capable of if they were running on heavy rails. The result of this is that the line is not so advantageous to the district which it serves as it should be.

2331. Do you think it was entirely a question of the rail—not of the sleeper?—I think it was the rail rather than the sleeper; at any rate, that was the general opinion of the railwaymen who are operating around there. I think it is a 60 lb. rail there.

2332. To Sir VINCENT RAVEN: I think they are all new rails there, not second-hand.

2333. Sir SAM FAY: You left No. 3 out, did you not?—Yes. Under that heading, No. 3, *i.e.*, "Whether it is advisable or otherwise that the engineering construction and repair department should be placed under a separate department under a costing system"—I did not deal with that specifically because we really got on to it when discussing No. 1 and No. 2; and I do not know that there is much more that I could add to that.

2334. I do not quite follow what it is that you are suggesting. The engineering construction is a separate department now. You are referring to construction of new lines, are you?—No, to the construction of new engines—the building of new rolling-stock. This is entirely on the chief mechanical side. The construction of new rolling-stock and repair work are both carried out together at the present time under the Chief Mechanical Engineer, and the suggestion is that would it not be advisable that repair work should be kept separate from the construction of new engines and rolling-stock.

2335. Sir VINCENT RAVEN: Do you suggest that the building of a new engine is something quite different from the reconstruction or repair of an old engine?—It is

Witness—H. V. C. Thorby, 1 August, 1924.

when you are in such a confined space, as is the case in the Eveleigh workshops. With the space that was available previously for the repair of the running engines as they came in, the result was that the repair section was deprived of the space which was properly required. Provision is now being made for new sheds at Enfield—that is, Ohullora—and the suggestion is that if new work is carried on there, the repair depot should be kept separate as far as possible.

2336. You do not suggest that they should have a shop for building new engines, and another shop for repairing engines, do you?—Yes, that is the suggestion we make.

2337. I do not know whether that proposal comes from an engineer or whether it comes from someone who is not conversant with the practices, but the fact is that most of the work for new engines is done by machines—it is done in the forge and in the smith's shop, which must be common shops and common machines for dealing with the repair work as well as the new work, and therefore if you are going to separate the two you will have an immense duplication of machinery for dealing with it. The actual space required for erecting an engine or doing new work is very small indeed; therefore it would be most uneconomical to separate the repairing work from the new work. In any railway that I have known or been connected with, the new work and the repair work have always been dealt with together, as being the most economical way of doing it.

2338. Sir SAM FAY: Have you any more to say on that subject?—No, but I will leave with you the report of the engineers working in that department.

2339. Sir VINCENT RAVEN: I quite agree with them if they say that the amount of repairs which have to be dealt with at present are so great as to fill up the whole space and time of the machines and the working space in the Eveleigh shops—that is another matter altogether.

2340. Sir SAM FAY: Are you dealing with No. 5?—Yes, as to the desirability of constructing additional cross-country lines. We bring that under your notice—

2341. That does not come within our terms of reference?—No, but we bring it under your notice because under the present conditions the Railway Commissioners are compelled to haul a tremendous amount of stock and forage and general merchandise over excessively long distances because certain lines are not linked up with cross-country sections. Previously to the construction of the Dubbo-Werris Creek line, it was necessary, when transferring fodder or stock from Dubbo to Werris Creek, to bring it all through Strathfield, and in doing that they had to haul it 527 miles; whereas by the construction of this short length of line they now only haul it 182 miles. The result of that is that owing to the shorter distance of haulage the consignee reaps the benefit of 9s. 6d. a ton on chaff alone—to take an illustration; also the Railway Commissioners are getting 1d. per ton per mile for the haulage as against ½d. per ton on the long distance route. In acceding to this suggestion that we put forward, of making certain connecting links between main lines, it will obviate a lot of haulage and increase the rolling-stock available by releasing it quicker, and enabling the engines to do more work. It would overcome the shortage of trucks to a great extent during drought time, and eliminate the long haulage and the grades. In this connection we strongly suggest—if it is competent for you to consider it—that the northern tablelands should be connected with the coast at some suitable point—somewhere in the direction of Inverell and Guyra. Of course, Guyra-Dorrigo is the proposal that is most easily negotiated.

2342. Sir VINCENT RAVEN: It is very hilly country over that area; I have been over it and I know.

2343. Sir SAM FAY: We are going to Newcastle. I suppose the authorities there will be able to give us some information as to that?—Yes, the Newcastle people will point out the desirability of a connecting link almost due west from Newcastle to Dubbo, linking up through Gulgong and Maryvale.

2344. As to No. 6, regarding the number of employees in the railway and tramway service?—I am not responsible for that being there, and I do not know much about it.

2345. Then, Nos. 7, 8, 9, 10, and 11 have been dealt with. Do you wish to refer to those?—There are one or two things I would like to add to Dr. Kater's remarks. I have some papers which I will leave with you, showing that the methods of the Railway Department in constructing sidings, &c., is against the encouragement of private sidings, and the cost seems to be excessive. With regard to No. 8—that the present Railway Appeals Board be reconstituted, in the interests of justice and discipline. I should like to emphasise that it is essential that we should have a Railway Appeals Board. I have no great fault to find with the operations of the present board, though I understand a large proportion of the punishments that were administered by the authorities have been reversed by the Appeals Board.

2346. Is that a fact?—Yes, that is correct.

2347. Do you refer to the total punishments, or to the number brought before the Appeals Board?—The total punishments that were administered by the department, and the reversals by the Appeals Board, resulting in exoneration and reinstatement of the appellant. I am referring to the punishments appealed against; not those that were not appealed against.

2348. The evidence which we have at present is that comparatively few of the punishments inflicted are appealed against?—Not a great number are appealed against, but a fair proportion are reversed of those that are appealed against. By way of illustration, there is a tendency in some quarters to suggest that the Appeals Board should be reconstituted, and in others that it should be abolished. The Appeals Board is the only safeguard to many of the men against senior officers who apparently set themselves out to victimise their subordinates. As an illustration, I will take the case of a station-master at Glenbrook, who after an accident between Glenbrook and Emu Plains was disgraced to the position of relieving night officer. An appeal to the board caused him to be exonerated and reinstated, because the departmental inquiry had not given him an opportunity to state his case fully, and to show that it was not his fault at all. Another case is that of a young railway officer in the north who was instructed to go to a station in the south. His wife at the time was within a week or two of being confined and was under medical treatment. He asked for time, which was absolutely refused, and he was told to take up his duties within three or four days. He made a further appeal to the department and produced a medical certificate from the doctor attending his wife. Eventually, however, he carried out his instructions from the department. His wife became ill and was taken to Sydney Hospital; the child was lost, and his wife almost lost her life. After the affair was over, this man sent the account for the medical fees to the department. They immediately dismissed him from the service for endeavouring to obtain money which he was not entitled to. He appealed to the Board and was reinstated by them, and they recommended that he should receive full pay for the time—it was a fortnight—during which he was off duty, and that he should be compensated for the medical expenses he had been put to. I mention those two cases as instances of the necessity for the protective influence of an Appeals Board.

2349. The effect of the Appeals Board is this, is it not, that it takes out of the hands of the Commissioners the jurisdiction over the men; for this reason, that if the Chief Commissioner gives an opinion, there is no appeal. Is that so?—I understand that is the law.

2350. Therefore, the Commissioners, acting in the belief that they will be going against public policy, do not deal with the men, but leave it to the senior officers to do so. That is the effect of the Appeals Board, is it not?—Yes, the Chief Commissioner himself does not apparently interfere to any great extent.

2351. Sir VINCENT RAVEN: These men who think they have been unjustly treated by the departmental officers do not appeal to the Chief Commissioner, but to the Appeals Board, because they think the Commissioner would uphold the decision of his officers?—In the cases I have quoted, it is the general opinion of the railway employees that they get a much better deal from the Appeals Board, and they are very much afraid that the Commissioner, in case of an appeal to him, would uphold the decision of his officers; and, if he did, the men could not appeal.

2352. Sir SAM FAY: Therefore, the Commissioners are eliminated altogether, in effect, from any jurisdiction over the men?—Yes, they are relieved.

2353. They could say, "We will deal with the men," and in that case there could be no appeal as we understand it; do you agree that that is the case?—Yes, that is the operation of the Appeals Board. Still, I do not think it advisable to eliminate the Appeals Boards, although some slight reconstitution might be deemed advisable.

2354. The next matter is No. 9, dealing with the suggestion that faster transit be arranged for stock trains and unnecessary delays eliminated?—At present on a great number of our branch lines, the practice is to collect stock twice a week—they have two trucking days. If it could be arranged that one trucking day would meet the requirements of the stock-owners and the department, it would be possible to collect the stock in most cases with a special stock train which would carry nothing but stock; whereas at present the bulk of the stock are picked up on mixed trains, and I think you will agree with me that it is a great disadvantage to travel stock long distances on mixed trains, because the trucks are loose coupled on the mixed trains, whereas the stock trucks are tight coupled.

2355. But when they are conveyed from the branch line, are they not collected at the junction of the main line and sent forward in a complete train?—Yes, to a certain extent; still, there are quite a number of mixed trains—particularly, in the case of the small stock-owners who cannot afford to band together like the big graziers and make up a full train between them. I contend that it is possible to arrange a better system of picking the stock up and eliminating the delay in transit. Under present methods, stock are trucked at 4 or 5 o'clock in the afternoon and not shifted sometimes until 3 o'clock next morning, and they lie for six or seven hours at different depots waiting for trains to be made up. It is not the actual speed of the train that is complained of; it is the long waits to which large numbers of stock are subjected at the depot stations.

2356. No. 10 deals with the suggestion that a more adequate supply of trucks be provided for the carriage of live-stock and produce?—Dr. Kater emphasised the necessity of giving the stock-owners an opportunity of purchasing their fodder at any time of the year, and give them the same starving stock rates as are given during the drought periods. The disadvantage of doing it during the drought period is that then the railway is congested through shifting starving stock and the opportunity is lost then for getting a lot of the fodder that could previously have been bought up at reasonable rates, because during drought time fodder is naturally much dearer. If this practice were adopted, it would be an inducement to many of the lucerne and hay growers to grow more than they do at the present time, knowing that there would be a ready market for their produce to the graziers, who would be glad to buy the produce and put it by as fodder reserve in anticipation of drought. The adoption of this practice we feel would be to the mutual advantage of the stockowner, the producer, and the Railway Department.

2357. Do you think that a sworn declaration would be a sufficient protection to the Railway Commissioners?—Yes, there are only isolated instances where deception has been attempted on the part of dealers in the past. On that question, you asked Dr. Kater whether it was possible to have a dual truck which would be convertible

from a closed van into a sheep van. In that connection, I may say that I designed a truck for that very purpose, about eight years ago, which I submitted to the Railway Department, but they did not consider it suitable. The idea was that the centre floor would be movable and you could convert it and roll it up like that (*illustrating*) and pass it back to each end of the truck, converting it into a cattle truck or into a van for carrying hardware or general merchandise.

2358. Sir VINCENT RAVEN: Did they give you any reason for not accepting the design?—The principal reason given was that the manure would get all over the two rollers and would probably cause a clogging; but as I pointed out, you would only require it during drought periods, and it would be easily workable. They did not give them a trial. I have the designs if you would care to peruse them.

2359. Sir VINCENT RAVEN: I do not think that is necessary.

2360. WITNESS: Another matter I want to bring under notice is that a large number of steel trucks were turned out with almost solid steel floors. They are a great disadvantage during the wet weather in the case of wheat or chaff or anything like that lying on the floor of the truck—the lower layer becomes rotten or damaged, whereas a wooden floor is much better for general produce, though requiring a little more repair. They are not building those now, but there are a large number of them in use.

2361. Sir SAM FAY: No. 11 we dealt with. No. 12 is as to the standardisation of rolling-stock?—I have quite a lot of matter here that I would like to submit to you about that, but perhaps I could leave that until a later hour, and deal at present with some shorter subject.

2362. Then will you take No. 13?—Yes, that is in connection with motor trains. Some years ago a motor train was built on the Grafton-Lismore line. It was a Moreland motor-lorry converted into a motor train. It has given very satisfactory results to the travelling public, and has been very profitable to the department. We strongly advocate the construction of more motor trains for the branch lines in the outlying districts, where the country is level. The Commissioners built the No. 2 motor train, it being a suburban car converted into a motor train. Our contention is that experiments which have taken place with such a system have not been satisfactory; but they are now building lighter motor trains with modern engines. The trouble has been that the country people are not getting the facilities that they are entitled to, with the result that traffic is being driven off the railway lines instead of being attracted on to them, and we consider it would be advantageous for the department to buy motor trains, which have been so successful in South Australia, and thus give the country people a fast and efficient service straight away. By doing that a tremendous amount of traffic would be attracted on to the railways instead of being diverted from them as at present. As an instance, take the Dubbo-Merrygoen section, where a train runs only three days a week. That means that to come to town to do business a man would have to be away from home four days. The majority of the people drive into town, or do not come in at all. In that particular instance the distance is about 20 or 30 miles. Taking Elong as an illustration; there are three trains a week, and if you come into Dubbo on the afternoon train on the Tuesday, it gets in too late to do business—the banks are closed and you cannot leave the next morning. On Thursday the train is coming in again, and you cannot go back until Friday. You can see that that class of service does not attract the passenger traffic. That state of affairs applies to practically all the branch lines in the State—i.e., the service is only a two or three days a week service, with the result that passengers very rarely travel on the line. Commercial travellers, in order to do their work, hire a car between three or four of them, and thus do it more expeditiously than they could hope to do by travelling in the train.

*Witness*—H. V. C. Thorby, 1 August, 1924.

2363. Would it satisfy the people of those districts if a train were run so that business could be done in the next town, enabling the business people to get back to their homes that night?—Yes, I think that would satisfy the district, but you could hardly fit in with the time-tables on the main lines unless you introduced motor trains, which, of course, can travel quicker. The trains that do run are mixed trains, which travel on an average from 8 to 12 miles an hour.

2364. Then you complain of the time-table connections on the branch lines?—Yes, they are bad in many instances, which is largely owing to the fact that the majority of them are run with mixed trains, and have to connect with the mail trains, and they cannot keep up with the mail trains. In New South Wales nearly all the mail trains leave Sydney between 7 and 10 at night, and arrive in most of the country districts the following morning, where most of the branch lines start; then it is a matter of fitting in the cross-country lines between, say, 6 and 10 in the morning and getting across to the other main line in time to catch the return mail to the city. That can be done in nearly every instance with the motor trains, because they do the trip quickly. I cannot too strongly stress the importance of a motor train service, and I point out that it is in use in other States.

2365. You are not concerned as to whether it is a motor or an engine which does the work, so long as you get a fast train?—Yes, that is so. Still, on that point we have come to the conclusion that the motor train is the only solution of the difficulty, because the other would hardly pay on close lines, the traffic being so light. My idea is that a motor train is much cheaper than a small engine.

2366. Would you like to speak with regard to the provision of dining cars?—No, I do not think that would be of much advantage in New South Wales. Dining cars are very heavy, and would overload most of our mail trains, and I think that if the refreshment-rooms are properly conducted they are quite adequate.

2367. Then No. 16, as to the construction of new carriages for long distance travelling?—The reason for that is that in long distance travelling there is every reason why a corridor car should be put on. One reason is that it is much quicker to enter and leave the corridor car, and they are much simpler for the staff at the platforms—no doors or door handles to watch; also in the country districts where our platforms are mostly short, in many cases passengers have to climb up and down from the rails in box carriages, whereas with the corridor car they can get in the nearest car and traverse the train until they reach the compartment they want. We contend that the corridors are much more convenient and comfortable for long distance travelling; also there is no necessity for a smoker to smoke in a non-smoking compartment, as they can walk in and out of the different cars. Another objectionable feature of the box carriages is the close proximity of the lavatory to the seating accommodation, as there is very often a nasty odour from the lavatory.

2368. Sir VINCENT RAVEN: You have to consider the extra weight involved in the corridor carriage?—Yes, I admit that, but I think the extra comfort supplied to passengers warrants the extra weight.

2369. Your lines have very heavy gradients, you know, so that any extra weight must be a matter of very careful consideration?—Yes, but the majority of places that have the corridor cars are places where they have grades, *e.g.*, on the Southern and Northern lines. At any rate it is the general opinion that the corridor car is favoured by the public.

2370. Sir SAM FAY: You suggest in No. 17 that the Railway Commissioners should be deemed to be common carriers?—Yes, we contend that the Railway Commissioners should accept the responsibility of delivering whatever is placed in their care in good order. We have instances where, for instance, a truck of wheat which was consigned at Gravesend to Alexandria, was missed, and eventually found to have been de-

livered at Narrabri, in the north-west, to a miller. The owners of the wheat would not accept the miller's price, which was about 6d. a bushel less than they would have obtained in Sydney. After a lot of trouble, the Commissioners agreed to pay 3d. per bushel compensation, although they were not bound to do so. There are cases where goods have been lost. In some cases the Railway Commissioners have made the loss good. I have an instance where a truck of chaff was burnt while on a truck within 8 miles of its starting-point, the responsibility for which the Railway Commissioners refused to accept, though it is clear that the fire must have had its origin in a spark from the engine. We contend that the Commissioners should accept the position of common carriers and be responsible for what is placed in their charge.

2371. I do not know what your Common Carriers Act in this country is like, but the English Common Carriers Act does not prevent a good deal of litigation. That Act says that certain things shall happen in certain circumstances, and there is very often a good deal of litigation in deciding what the circumstances are. The Commissioners are at present spending from £11,000 to £12,000 a year in compensation. Well, the acceptance by the Commissioners of responsibility under the Common Carriers Act would not prevent disputes as to liability?—I can show you many cases where the Commissioners, through neglect, have brought about tremendous losses to owners of produce—yet there is no remedy. On one occasion about thirteen or fourteen trucks of chaff were saturated with rain for the want of tarpaulins. It is the Commissioners' responsibility to cover chaff and wool when they are loaded. This chaff was saturated with rain, and had to be dried in the sun, but it was damaged all the same.

2372. I recollect more than one committee, and more than one inquiry during the last ten or twelve years in connection with railway companies' liabilities, and suggestions were made, and sometimes accepted by the companies, that they should be responsible outside the Common Carriers Act, because that Act did not give the protection which the public thought they ought to have. The Common Carriers Act is not going to cure all their troubles in that respect?—We do not specify definitely that the Commissioners should come under the Common Carriers Act, but we submit that as common carriers they should be responsible for all loss or damage to goods while in their care in transit—that is, of course, so long as the goods are received in good order and condition.

2373. You mean, if the Commissioners are wilfully negligent?—We contend that where it is the fault of the Commissioners—as in the case of no tarpaulins—or through their neglect, as when there is a delivery to a wrong destination—or where goods have disappeared, been damaged, or been stolen, that they should be responsible to make good the loss.

2374. Are not they responsible to-day?—No, not unless you send the goods at the insured rate. There are two rates on the railway, namely, the insured and the uninsured. There is very little merchandise consigned at the insured rate, particularly produce and that sort of thing. The insured rate is not a much higher rate than the other. I have discussed this matter with Mr. Fox, one of the Commissioners, and he seems favourable to the striking of a flat rate, which might be a slight increase on the low rate to-day, which would cover their losses for compensation. That would overcome the tremendous amount of quibbling that goes on at present between consignees and the Department. We think it is only just that when a man sends his produce in good condition to the Department, they should see that it is delivered as nearly as possible in the same state at the other end.

2375. I would suggest that you look into your Common Carriers Act here to see how far it would protect you, for, unless it differs materially from the English Common Carriers Act, you would not, perhaps, be much better off

than you are now?—We may not get all that we desire under the Common Carriers Act, but our desire is that the Commissioners should be responsible for losses and damage and that sort of thing. Take such a case as that which happened to a cast-iron bath which was consigned from Sydney, and when it reached its destination it was split at one end; also, in another case, some concrete tubs were damaged; also the same thing happened with lead-lights in crates. That is not fair treatment. We contend that the method of handling goods on the railway is extremely rough.

2376. Sir VINCENT RAVEN: Are they not responsible to-day for breakages?—No, not unless you consign the goods at the insured rate.

2377. Not if it is their own fault?—No—although sometimes they will meet you if they feel it is absolutely through their own neglect or negligence, but it is a very difficult matter to get any compensation from them.

2378. Sir SAM FAY: Here, as far as my observation goes, a great many things are sent about without being packed; they are sent about in a way which in England would result in their being refused acceptance by the railway companies; but here they take such goods, at your risk?—Yes. Of course, if the Commissioners agreed to accept the risk, we agree that they would have the right to stipulate that breakables should be carefully packed in accordance with the Department's regulations. In the case of produce, however, and goods of that kind, where it is not a matter of packing, and where it disappears or where there is a big shortage, or where these goods have been damaged by water and that sort of thing, we contend that the Commissioners should make compensation.

(Luncheon adjournment, 1 to 2.15 p.m.)

2379. Sir SAM FAY: I think we got down to No. 17. Would you like to go back to No. 12?—I would like to submit this report to you to save your time.

2380. What is the report about?—I am just submitting it to you to draw your attention to several matters, under the heading of standardisation. For some considerable time the condition of the engine-tenders in Eveleigh has been the subject of much comment, and I contend that it is in this section of the railways where the most fruitful cause of complaint to the producers of New South Wales is found. I do not need to read it all to you, but I would point out that for a considerable number of years we have had serious difficulties with the Railway Department, both in the supply of trucks—as has been pointed out before—the slowness of trains and cancellation of trains, and all that sort of thing; and in 1919 I approached the Railway Commissioners and went to the Eveleigh works with Mr. Lucy, had a general look round, and I was satisfied that was the seat of all the trouble at that time, with information I had received from different officers of the Railway Department, was in the engineering section of the Railway Department, particularly so far as the engines are concerned. I came to the conclusion that practically all our troubles can be traced back to engineering troubles, and I submit here for your perusal one of the Department's own official lists, which shows clearly that they have over thirty types of engines in the Railway Department at the present time. Those engines have been altered in many cases, with regard to superheaters, and with regard to various classes of oiling apparatus, from grease to oil, and from oil back to grease lubrication. In every direction they have been altered, and even the latest K class engines, designed only recently, two of them were built, and then the design was altered. The NN engines have been altered in many ways. Then, again, there is a new engine being designed now, called NN No. 2. When you come to look at the position you find that there is no such thing as standardisation, as far as I can find out from the officers of the Department—men who are working in the workshops all the time—and it appears to me that that is one of the troubles we are up against—the class of engine we are dependent upon to do the whole of our haulage throughout the State. It is shown right back to 1916;

there are comments there from the locomotive drivers themselves. In 1916 also there was a report by the officers of the Department. Then I give you a good many comments I have put in myself in connection with oil lubrication and the values of various engines. I give quite a list of engines there, which, if it is necessary you can refer to me under those numbers, and call for reports in connection with those particular engines.

2381. Sir VINCENT RAVEN: Of course, you hand this in, but if you had handed it in before you came here one would have had an opportunity of asking questions on it, and of course one does not get that opportunity now?—I would like to explain the reason for that. I was detained in Melbourne for a week on other matters at a conference over there when I intended to complete and hand it in to you.

2382. You see, everybody would agree that limited standardisation was an excellent thing, but if a railway company has got engines which have been in existence for the last sixty years it is quite obvious that you must have an enormous number of different classes of engines, although it may be the policy of the railway company in the future to reduce those down to a definite minimum standard?—That is exactly why I emphasise the point. I am not referring so much to the old engines, but I am referring to the latest designed engines, which are being continually altered in many respects. In addition to that, the NN class of engine is only a new engine, three or four years old, but a new design of engine is coming out. In 1922 it was on the list handed in, and only one of those engines is built to-day, and it is only in the experimental stage. I would like also to refer, for your information, to the alterations that have gone on in connection with the construction of the tender, the draw gears, the alteration of the tyres of the wheels of the whole of the rolling stock, and that sort of thing. The tread of the wheels of the rolling stock of this State was a conical tread—I think that is the correct term—and they were altered by being lathed to cylindrical. That was found to be a failure, and then they were altered back to conical. I will show you that, in a report I have from the Railway Commissioners. They are matters, I feel, which are worthy of your consideration, to see if the engineering affairs of the Railway Department are being administered in the most competent or capable way, and if it is necessary that all these experiments or alterations should be going on continuously, and hanging up a large number of engines, and preventing any conformity in standardisation being established at these works. That is a phase I want to bring under your particular notice. As experts, I feel it is only a matter of bringing your attention to items of this sort, and you will be able to see at a glance if what I say is correct. If it is not correct, then you will be able to discount my evidence.

2383. But the alteration of the tread or the formation of the tyre, both in the flange and the tread, would only take place when the tyres were re-turned up, and therefore there would be no extra cost or unnecessary cost, supposing you were altering the formation of a section of your tyre, because it would only be done when the tyre came to the shops for re-turning?—Yes, but in carrying that out, I am informed that to do that you would have to take off a considerable amount of the steel of the tyre if you lathed back by the ordinary practice to get a conical tread.

2384. It all depends on what alterations have to be made?—Yes. I will just quote briefly here the Commissioners' own remarks when I referred the matter to them. I stated that—

"A great deal of time and material was used in what to me seems to have been an experiment by having engines' tyres turned up to cylindrical tread, and when that was found to be a failure they were turned down to a conical tread again, which meant the lathing off of thousands of mileage per tyre at a time when tyres were very scarce and dear."

Witness—H. V. C. Thorby, 1 August, 1924.

The departmental reply to that was this:

"American practice was for very many years to turn the tyres of all vehicles (locomotive and other rolling-stock) cylindrically, and in tests which were made to determine the draw bar pull to be exercised to move a given tonnage it was found at one time that the pull on American stock amounted to 4 lb. per ton as against something over 6 lb. per ton on British locomotives and rolling-stock, and it was the opinion of many engineers that the lower draw bar pull in the case of American stock was due to the fact that the wheels, being cylindrical, always rolled on one diameter, and there was on this account less wheel slip than occurs to some extent with coned treads. It has been further the opinion of many engineers that carriage stock with cylindrically turned tyres have smoother motion than those with coned tyres. It seemed to the Commissioners that an experiment with cylindrical tyres was, on the information available to them, at least worthy of a test, and a test was accordingly made. The results said to be achieved in America were, however, not achieved here, due probably to the fact that all rails of the New South Wales permanent-way are canted 1 in 20 to suit the English practice in coned-wheels, but the experiment involved practically no expense while giving information of considerable value."

Personally, I am not an engineer, but I questioned how the alteration could have been carried out without involving expense or wasting of the tyres. The fact that the rails are 1 in 20 suggested to my mind that it was no use trying to put a cylindrical tread on a rail which was built specially for a conical tyre. It is a matter, however, which I wish to bring under your notice, to let you clearly understand the class of work that has been going on in the Railway Department in connection with our engines and rolling-stock for years. You have the same thing in connection with the drawbars and on the tenders.

2385. Before you leave that, I should judge that it was an experiment which would probably be carried out with one or two engines, and not with the whole stock?—I am informed by one of the engineers in the works that practically the whole of the rolling-stock was converted to cylindrical and then converted back.

2386. That is hardly an experiment?—I am not in a position to say that every wheel was turned that way, but that is the information I have received, and there is the Commissioners' own official report in reply to my statements. Following that on, I would like to mention another complaint I have against the administration of the workshops in connection with the class of tyres used on the NN or express engines. For the last six years on those engines the tyres have been burst periodically. Whether it is the usual thing for engines of that description to lose their tyres or to have them burst I could not say, but I can give you, or the Department can give you, a list of the extraordinary number—to my mind—of tyre bursts that have happened on the NN engines.

2387. Do you mean broken tyres?—Yes, broken into four or five pieces. Take NN engine No. 1034, tyre burst at Gosford, on the North Coast mail, flew into three pieces, 7th October, 1919. That is the first I have a record of.

2388. Have you got all the dates there?—I can give you the dates right through if you wish them.

2389. Yes, I would like to have the dates, but are you going to hand that report in?—Yes, I can leave that with you. The dates are all there, but I have a more recent list of dates, bringing it up to a few days ago.

2390. Have you any information as to when the tyre broke, and whether it broke so that a part of it fell away, or did it simply crack and the train was able to come to its destination, and it was found cracked?—No, in some cases the wheel has fallen off the engine, axle and all.

2391. That is a broken axle?—What I am referring to is broken tyres, when this particular tyre flew to pieces and came right off the wheel in pieces. In other cases the tyres have become fractured, and then of course they have been condemned.

2392. Sir SAM FAY: Are there any recent cases of that?—Yes.

2393. We can get the details from the official record?—Yes, that is why I felt there was no necessity for me to get you the official records.

2394. But you can give us the dates?—Yes. The next matter I would like to bring under your notice is the manner in which the Railway Department has periodically endeavoured, to my mind, to smother facts when they were put before them, and when we endeavoured to bring these matters under their notice their attitude is shown very clearly in this portion of the report also: "At that time . . . 1911 or 1912," that is, four or five years. They are there now, or at any rate they were on the 19th December of last year, according to the Department's official record. When I say they are there now, I could not swear that they are there at the present moment, but at any rate they were there from 1911 to 1923. "I stated that there were approximately 10,000 axles . . . at present." That is the official statement of the Department. "It is anticipated, however, with the return of normal conditions . . . in the near future." This is dated 27th October, 1919, but I do not want you to feel that it is ancient evidence that I am putting before you, because I want to follow it up with what happened in 1923.

2395. I think there was some difficulty in obtaining material here after the war?—Yes, but those axles were imported before the war was ever thought of.

2396. Then they were used, surely?—No, they were not used. Perhaps you will allow me to quote the concluding passage: "With regard to the stock of carriage and waggon axles . . . is £67,725." Following that up, on the 19th December, 1923, when we were examining the officers of the Department—

2397. On what occasion was that?—Mr. George Nicholas Clapart, storeman, Stores Branch, Railway Department, in connection with the claims of George Dingle against the Railway Commissioners, evidence given before the Select Committee appointed by Parliament. It was held on the 12th December, 1923. I will quote from question 716. I asked the witness:

Can you tell me the date when the 7,399 carriage and waggon axles went into stock at the Clyde yards?—A. No. Q. Are those axles still there?—A. No, a great many have since been issued; 1,000 of them had been issued and 6,000 still remained in the Clyde yard. (Q. Were there a large number of tyres standing in the yard?—A. Yes.

I see that goes on to tyres. The same witness was asked:

Q. You say 1,000 axles were distributed since 1919?—A. Approximately. Q. Would that be a normal quantity?—A. Yes, I suppose so. Q. The 6,000 you now think had been there since 1911?—A. Probably. They were there when I went there.

That was when he first went to the Clyde yard. Then the evidence goes on to stationary engines. Why I mention that to you is to show clearly why the Railway Commissioners, or whoever prepared this report—and it is over the signature of the Secretary for Railways at that time—refused to admit those axles were condemned axles, new axles which had been imported and condemned, or were not fit for use for some reason or other; and I contend that it was an attempt to mislead the authorities; and we find in December, 1923, 6,000 of the same axles still lying in the same place. I only mention that as one item where I have accused the Railway Department of allowing a considerable amount of waste to go on throughout the length and breadth of the whole of the engineering works. I will leave that report with you (*handed in*).

2398. I suppose you would say that in 1911 they could not have anticipated the war?—They had no idea of it.

2399. That was when they ordered all those axles, and if there had been no war they would not have been able to claim that saving?—They should show the loss by depreciation, but the point I am making is that those axles were not what they stated they were. The whole list of accusations I made against the Railway Department from start to finish, and the Railway Department's official replies, I now submit to you, to show that our grievances are not of recent date, but date over a considerable number of years, always endeavouring, of course, not directing our complaints against any individuals in particular, to try and better the position so far as the country people are concerned.

2400. Where those answers given through your House?—They were given through the Premier of this State.

2401. Through the Legislative Assembly?—Yes.

2402. Do you go on to No. 18?—In connection with the want of standardisation, I would like to add, in connection with the railway tenders, that for some considerable time past there has been a good deal of difficulty in the railway workshops over the alteration of the various draw-gears under the tenders. First there was what was termed the intermediate. That was then passed out, and the radial draw gear was introduced. The first design was rivetted to the bottom on the water tank. In other words, the engine was pulling the load of the train largely through the rivets on the bottom of the water tank. When double-headers were put on to trains there were very heavy loads to carry, and the result was a fractured tank, and that meant the engine going out of commission and going in for repair. That was then altered, and a design was put in known as a channel iron draw-gear. That was not strong enough, and it burst through. I can show you the photograph showing what I mean. Then that was altered to what was finally put in, known as a continuous draw-gear. That was put in without any bushes to save the wearing parts, and the result was they wore through very quickly. I can show you photographs of the wearing parts. There are two of the bolts (*indicating*).

2403. Were the bolts unbroken?—They were not broken; they were taken out. There were no bushes when the tender came into the works.

2404. Are these intended to illustrate the bolts when it was taken out?—Yes, the worn portion. That is to show how much they were worn.

2405. Some of them would break?—Some of them did break, and a driver and a fireman were killed through the draw-gear separating between the engine and tender, on the Southern line. The driver and fireman fell down between the engine and the tender, and the tender went over them as it came following along. In submitting that to you, it is for the purpose of bearing out my statements that in Eveleigh workshop a considerable amount of experimentation and faulty construction has been going on for some considerable time. If you would care to hear any further evidence on that point, you could hear the evidence of one of the workmen who has been constantly employed on that work. He would be only too glad to come along and give you details for as many years back as you wish to go. I do not think I need elaborate that matter any further.

2406. Then you go on to No. 18, the desirability of replacing the old engines in the country?—Before I come to that, permit me just to add here that in the Eveleigh workshops at the present time you can see large numbers of fractured frames. This photograph I produce is one of the channel irons with the draw gear pulled right through. You can see the centre portion there; that is underneath the tender. That is what they were pulling off, that channel iron. That is one of the fractured main frames. I can assure you that has been a regular cause of complaint amongst the engineers themselves right up to the present time, and it is contended by engineers there that that has been brought about by the introduction of spiral springs on the engine carriage, the bogies. Whether that is correct or not I am not in a position to say.

2407. I am sure I am not?—I can give you a list of those engines that have been coming in repeatedly and regularly with broken frames. It seems to me to be a remarkable thing that that should be so if the workmanship is what it should be.

2408. Sir VINCENT RAVEN: Does that refer to a particular class of engine?—You will see particulars and the number of the engine on the back of that photograph.

2409. I see it is an engine, but what I mean to say is whether a particular class of engines have their frames broken more than any other?—Particularly since spiral springs were introduced on this class of engine. That is a P class, is it not?

2410. Yes, but there is nothing on here about spiral springs or the reason why it broke?—No, but I can get all that detailed information for you if you wish. I have volumes of detailed information, such as dates when engines came in, repairs effected, and so on, and the officers who attend to that work can give you first-hand information if you desire it.

2411. I do not know if I do, because it would take me a very long time to follow out the reason of failures and fractures on the different kinds of engines. I am afraid I could not promise to go into that? No, but I thought that by directing your attention to these various points that you might have a report prepared by the department, setting out their views as to how these things happen, and the number of times they have occurred.

2412. I think they would very likely give me an explanation?—They would be able to give you all the particulars you require, but if you wish to have the numbers, I can give you the numbers of the engines and the dates upon which the various fractures have occurred.

2413. All I want from you is this: do you say that a large number of these cases have occurred?—Yes.

2414. Do you say that definitely?—I do.

2415. Do you also say that they have occurred with one particular class of engine?—Yes, particularly with P class engines.

2416. Sir SAM FAY: That is all we want, unless you wish to add anything more?—I do not want to prolong my evidence by going into more detailed information unless you desire it. I will proceed now to No. 18. The object of that portion was this, that on the back country lines, where we have very light rails—as I pointed out in connection with the Werri Creek line—old heavy class engines have been put out on the back country light lines, and the big TF class, which weights over 100 tons, with eight flanged wheels, when negotiating curves on these light lines, spread the rails, and of course they do a considerable amount of harm, and it means following these train along where they take a load over these light lines. The objection to TF engines on these lines is the eight flanges, which do not permit them negotiating the curves without injury to the track. The T class is only flanged on the two leading and the two trailing wheels. On the four centre wheels there is just a flat tyre, and they do not do the damage the TF class engine does.

2417. Would not the engineer for the line keep those engines off if they were doing that harm?—That is just what you would expect, but the position is that they are not kept off. They repeatedly go over those light lines. When they are short of engines they just put heavy goods engines on to passenger trains. That is the state of things to-day, and they are not in running order or in good working condition, a tremendous number of them.

2418. No. 19 is the question of the policy of building large trucks. You refer to the 25-ton truck?—25 and 40 tons. I think it is 16, 25, and 40 tons now. The difficulty farmers are up against particularly is this: The Railway Commissioners quoted a fairly reasonable rate per ton, but they stipulated that you must load to in some cases within 2½ per cent. and in other cases to within 5 per cent. of the carrying capacity of that truck. It is often practically impossible to get the required load on to the truck, particularly in the case of chaff. With chaff you cannot get the stipulated load on to the various trucks that are supplied, and the result is you are not getting the chaff carried at the rate quoted by the rate-book. You are paying for more chaff than is actually on the load. That also has an effect in the Railway Commissioners' statistics showing the tonnage carried and the rates paid, and we seriously suggest that it is advisable that a considerable number of smaller capacity trucks should be constructed from time to time to meet the requirements of the small consignors and consignees, because the Railway Commissioners do not encourage mixed consignments—that is, three or four different consignors using the one truck—unless the one person pays the whole of the

Witness—H. V. C. Thorby, 1 August, 1924.

freight and it is sent to one destination; so we contend that we should have a fair number of small trucks constructed to meet the requirements of the small consignors.

2419. There would be no necessity to build a special form of truck provided the Railway Commissioners reduced their minimum?—If they will reduce their minimum that will suit us all right, provided a lower minimum applies.

2420. You say in your evidence that the rate which they quote is an ineffective rate for the reason that you cannot get a load on?—You cannot get a full load of chaff on to a truck.

2421. Does that apply to any other commodity?—It applies to most commodities, except wheat. With wheat we can get the load. With oats it is difficult to get the load. With timber it is the same thing, and it is the same thing with the majority of truck loads. Then with smaller consignments, even if you can get the loads you may not have the quantity that will fit the truck, although the Commissioners retain the right to fill that truck up if they so desire; but they are charging an excessive rate, as we can show you from the official rate-book. The minimum weight of a 12-ton capacity truck is 11 tons, on a 16-ton capacity truck 14 tons, on a 25-ton capacity truck 20 tons.

2422. Does that apply to everything?—That applies to most commodities. There is a slight variation for different products, but not to any very great extent. It is a very vexed question with producers to-day, because we contend that we are not getting the benefit of the rates as quoted. We have to pay for tonnage we do not truck, so it is a matter which we feel is well worthy of your attention, and possibly your support in our request for a reduced minimum on the truck. We fully realise that from a railway point of view it is to their advantage to keep the minimum rate up as high as possible, because it means a bigger revenue and prevents a considerable amount of light running on the lines, but at the same time we contend that the producers are being unfairly penalised.

2423. Supposing you have a consignment of 20 tons, and you load up to 16, what happens to the balance?—You would have to put that in another truck; that means to say, you would be the loser by having to pay for the minimum of the truck, of which you are only using a portion.

2424. So that, in order to get the advantage of the rate, you have got to send a particular quantity which can be put into 1, 2, 3, or more trucks?—Yes, otherwise you have to pay more than the real tonnage you are sending, and then a special rate applies. If you are only sending a small quantity of 2, 3, or 4 tons it comes under a much higher rate. It is roughly double rate than if you send a truck load, which is penalising the small consignor again.

2425. Now we come to No. 20?—I think Dr. Kater dealt with that.

2426. No. 21?—That really comes from the Stockowners' Association. The reason for that is that it is contended that a bogie wheel runs much easier; there is less oscillation. A bogie van has capacity for about 200 sheep, whereas a single truck has capacity for only 100.

2427. You prefer the bigger trucks?—Yes, as long as you can fill it. The larger stockowners prefer the big truck. They ride much easier, and there is much less jolting. Of course, the less couplings there are on the train the less jolting.

2428. I do not know about No. 22. I doubt whether that would come within the terms of our reference?—I am not responsible for that appearing there. You will understand that we represent three or four different associations.

2429. No. 23 refers to preferential rates?—I would like to draw attention to this. Under the present railway rate-book the Railway Commissioners have differential rates for products manufactured in Australia and products imported, particularly as far as leather, galvanised iron, and many other commodities are concerned. We contend, as users of the railway and producers at the same time, that

it is not the function of the Railway Commissioners to apply tariff duties or preferential treatment to any industry, as far as the question of whether the article is manufactured in Australia or imported is concerned. We do not want to injure Australian industry in any shape or form, but we contend that if any particular industry requires protection, then it should apply to the Federal Tariff Board and not to the Railway Commissioners. It is contrary to the Federal Constitution for any State to adopt any class of protection as between States. The Federal Constitution of Australia provides for free trade between the States.

2430. They do not charge, do they, increased rates on those commodities when they are coming, say, from Victoria?—No, that does not apply.

2431. I thought you were referring to interstate traffic a moment ago. I take it that you are referring only to foreign importations, and not to importations from other States of the Commonwealth?—No, it is quite right, there is no differentiation. I was thinking of the Queensland railways. As far as the import duty is concerned, that only gives the preference to the Australian manufacturer. The city consumer has the right to choose between imported or Australian-made articles without any preferential rate at all, therefore, it is only forced upon the country consumer, and we contend that it is the function of the Federal Tariff Board to place a higher duty on an article if they have reason to believe that the industry supplying that article cannot maintain itself; but it is not the function of the Railway Commissioners. We are very emphatic in that connection. We would like you to give very serious consideration to the matter, and pass judgment on the Railway Commissioners in adopting a sort of preferential treatment to goods, whether they are manufactured here or whether they are imported.

2432. What sort of view would be taken by the Australian manufacturer? Would he not take an opposite view to you?—Yes, but we contend seriously that he has no right whatever to expect preferential treatment from the Railway Commissioners at the expense of the country people. If they are giving the Australian manufacturer special concessions, as the Commissioners contend, they are not charging extra freight on the imported article, but they are charging lesser freight on the Australian article, but we say they are charging that lesser freight at the expense of the other users of the railway.

2433. You say that it is not the function of the Railway Commissioners to impose this preferential treatment, but that it should be imposed by Act of Parliament?—The Federal Tariff Board is the body which fixes import duties.

2434. You say the people of Sydney do not bear any portion of this, that is because they do not use the railways?—Yes, it is only giving a preference to the Australian manufacturer when the goods have to go over the railways.

2435. We will take No. 24, in the construction of new lines greater consideration should be shown to existing towns?—The reason for that was this, that in running new railway lines through the country, it invariably happens that the railway line of the railway station is set down about a mile or three-quarters of a mile from the existing town, necessitating the running of buses backwards and forwards. I understand the reason for that is the cheapness of the land, and if the railway line comes in closer to the town the cost of resumption is much heavier. We contend that it is a much greater advantage for the town to have the line closer in, even if it costs more at the time. Coonamble residents did it. When the Coonamble line was running into Dubbo, they paid for the resumptions so as to have the line nearer the town.

2436. And in No. 25 you referred to economy in construction; I suppose you are referring more particularly to the country stations?—We contend that a large sum of money is unnecessarily spent on the construction of railway stations and very long platforms, which could be obviated by the use of corridor cars or by the adoption of

a method of steps, particularly in the country stations. We do not suggest that the platforms should be curtailed in the busy stations here, but the expense of buildings could be curtailed, because our contention is that it is overloading the capital cost of the railway station, which is one of the biggest difficulties the Railway Commissioners are under at the present time, that is, meeting the interest on capital invested. We contend that everything that can be done, whether it is the cost of railway lines or the cost of stations or platforms or anything else, we contend it should be done, as long as it is not going to interfere with the proper working of the railway line of its utility.

2437. You do not suggest that the platforms should be done away with altogether, as is the case in some parts of America?—I do not think our rolling-stock would lend themselves to that.

2438. No. 26, ordering of trucks for travelling stock during drought time?—Dr. Kater dealt partially with that, but I would like to add to his remarks concerning the difficulties we have in ordering trucks during drought time for live-stock. Our difficulty is this: A considerable number of agents seem to have a method by which they monopolise a large portion of the trucks. The individual stock-owner is invariably told by the department during the busy time that he cannot get any trucks allotted to him for perhaps three, four, five, or even six weeks, which in many cases would be too late to save his stock. In the meantime an agent can come along and offer you trucks to truck your stuff away probably the following week or the week after, which goes to prove that the agents have the trucks, but they will only give you those trucks as long as you consign your stock to them, which is using the Railway Department as the means of compelling you to trade with certain firms.

2439. Does it mean that they anticipate a drought and order trucks ahead for sheep which they have not got?—Certainly, they order trucks for sheep they have not got, but they are anticipating somebody sending sheep to them. It is a matter I think the Railway Department should not encourage. They should be absolutely impartial in the allocation of trucks, and only allot trucks to those people who have stock to send away, or to agents who are ordering on behalf of stock-owners where the stock are actually in existence.

2439A. Do you think a sworn declaration would be sufficient protection for them?—I do. I do not think there would be any difficulty in getting that, and bringing it home to anyone who should violate the principle.

2440. There is another item here, the system of the cleaning of the trucks?—Dr. Kater emphasised that matter this morning. One of the difficulties is that since the introduction of the batten floor, particularly in the sheep vans, a space of about 6 or 7 inches from the floor is allowed to be blocked up with manure, and there is no ventilation, and there is no getaway for the urine, and all this has the effect of smothering some of the sheep. We contend that the trucks should be regularly cleaned, and when supplied they should be supplied in a clean state.

2441. Sir VINCENT RAVEN: There is the question of cleaning trucks by contract and so encouraging stealing?—The receiving agents at Flemington have pointed out repeatedly that the Commissioners let the cleaning of the trucks by contract to different individuals, and they were satisfied that a considerable amount of stock-stealing went on, and they attributed it to these people who had had access to the trucks and the yard at all times and hours, so that we contend that it would be much better to have the trucks cleaned properly by the department, by officials in the employ of the department. They would have a much greater check over them, and they would be able to select their men.

2442. Do they do a great deal of cleaning by contract?—I think practically the whole of the trucks at Flemington are cleaned by contract. There are also one or two other specific matters I would like to bring under your notice. One is the practice of the Railway Department at

the present time in saying that they are the constructing authorities as well as the traffic authorities of this State, that when a railway line is almost completed and certain traffic is allowed to go over that line—such as, we will take the extension from Barellan, where for three years the Railway Department carried three harvests of wheat over that line and charged approximately an extra 2d. per bushel to users, increasing the freight from 5½d. to a fraction over 7d.

2443. Was that before the line was finished?—It had not been officially taken over. We contend that it was an exorbitant charge, and preventing traffic from being carried over the line when it could have been carried at great convenience. We do not suggest it should be carried at a time unsuitable to the Commissioners, but when they can fit in trains which will not interfere with construction work there is no necessity for them to charge 2d. per bushel extra when it was recognised that the wheat was only travelling over 34 miles of new line, whereas it could have been brought 280 odd miles to Sydney at a rate of 5d. a bushel only.

2444. That is to say, they had not made rates for this new line, and a special charge was made for the use of it?—The Railway Commissioners' attitude is that it hampers the authorities by having traffic on the line while it is being constructed. We do not ask that this traffic should be allowed until such time as the railway is in a workable condition, and only—particularly when it is approaching the harvest season—to enable farmers to get their wheat harvest away. I have a petition here signed by a number of farmers on the line where they have been petitioning the Railway Commissioners to allow them to use the 30 odd miles of the railway line from Molong, which is practically completed with the exception of the signalling apparatus. That would overcome their difficulty to a great extent, and would greatly assist them if that concession were granted. There is one matter I mentioned to you by letter, through your secretary, when I asked you if you would call for the papers in connection with the death of the station-master at Wellington. I do not know if you have looked into this matter in the meantime, but I would like to draw attention to that as a specific case of harshness on behalf of superior officers, particularly with reliable station-masters. That is only one case, and I would also refer you to the case of Mr. Norwood, station-master, Geurie, and Mr. Ellick, station-master, Borenore. I particularly refer to those two cases because they are typical cases where the department has endeavoured to inflict punishment upon two officers by the exchange of stations. Neither of them wanted an exchange, both of them were in fact opposed to it, and neither officer was disgraced. It merely meant that the department adopted a method of hampering their own operations by putting two station-masters out of gear for about a week while they were transferring their furniture from one district to another. Personally, I think it is a ridiculous method to adopt. If they were guilty of anything they deserve punishment, and then punishment could have been meted out to them without upsetting the staff and necessitating two relieving men taking charge for a week.

2445. I thought you said one of them died?—No, those were two separate men; I am sorry if I have confused them with the one who died. The other case I am referring to is the case of a station-master killed in shunting operations. Previous to that the staff was reduced by two shunters, necessitating him working until 11 o'clock at night. I can give you detailed information I obtained from his widow. I contend that he was treated very harshly, and there was no necessity for the attitude which the superintendent at Orange adopted towards him, when he hampered him all he possibly could. He did not give the man an opportunity to get on with his work, but flooded him with "Please explains" on every trivial matter that he could possibly think of. To show you the methods adopted by the Railway Department in attending to any of the minor works that are carried on, such as alterations to station-master's residence, I will just quote this in-

Witness—H. V. C. Thorby, 1 August, 1924.

stance, that at the same officer's residence previous to his death his wife asked for a ventilator to be put in the wash-house. I am informed that four different railway officers visited them, measured the house, and took all sorts of particulars, but the work was never carried out. If the department wishes to make a report upon this statement they are quite at liberty to do so, but I venture to say that you will find that there is a tremendous amount of time so wasted on the part of senior officers in attending to the most trivial matters. Another point I would like to draw your attention to is staff matters, in connection with the Chief Commissioner's annual tour. It is laid down by the Act that they should do so, of course, but the method adopted is to harass the railway officers in every possible way, so as to have everything spick and span ready for the Commissioner's visit. The officers are actually asked to do the painting of various parts round about the station. I will leave with you particulars of a few of the items, where railway officers have been asked to do kalsomining and painting on Sundays simply because the Railway Commissioners were coming round on their annual tour. These are some of the matters which create the friction and ill-feeling which does exist between the station-masters and senior officers to-day. I venture to say that if the Railway Department expects to get the best from its men it cannot expect to do so if it persists in harassing and pin-pricking them in every possible way.

2446. WITNESS: Another matter I would like to refer to. I have a case here which will give you some idea of the correspondence that goes on in connection with rebates for starving stock. The practice is for the Railway Commissioners to grant a rebate for starving stock. That creates a tremendous lot of difficulty and quibbling between the stockowners and the Railway Department at the present time. The system is that you pay your freight both ways, and then make application for a refund within a specified time, according to regulations. If you wish to see the specific cases which I have here with me I will leave them with you.

2447. Sir SAM FAY: Is there any great difficulty in getting the rebate?—If you do not happen to comply with all the regulations pertaining to it there is difficulty. At the same time, I would draw your attention to the fact that the same Railway Department granted rebates to the extent of thousands of pounds in 1923, according to the Auditor-General's report, to Hoskins' Steel Company, which the company were not entitled to. That company had not complied with the regulations, and were granted the rebate. When it comes to the stock owners, where the rebates are very small and are but minor items, the department turns them down simply because of technical breaches of the regulations. In this case I have before me, the stockowner was supplied with the wrong forms, apparently by the authorities, and on account of that his application was turned down. Then we have the position of the department refusing to grant the rebate that the regulations provide for restocking holdings. Special provision was made to encourage stockowners to restock their holdings during the drought, to prevent breeding stock being slaughtered at a time when the stock resources of the State were being depleted. The idea was to encourage landowners and stockowners to purchase in Flemington young ewes in particular, and take them back to their holdings rather than have them slaughtered here. I have before me a case where the department has been quibbling on a very fine point. Certainly they have been acting in that case on the advice of the Auditor-General; but in other cases those difficulties have been overcome by reference to the Executive Council. I am bringing this forward to show that the method adopted by the department in connection with these matters is not a very satisfactory method to the stockowner. If the stockowner had to satisfy the department previous to trucking his stock there would be no necessity for him to pay the return freight; he could pay the required freight on the outward journey, and they would be returned free, on a statutory declaration by the stock inspector.

2448. WITNESS: There is another matter which I would like to bring before you, and that is in connection with the departmental attitude when bush fires occur through sparks from the engines. The department is inclined to deny the fact that sparks had escaped from its engines and set fire to the grass. It is recognised by many, however, that large pieces of burning coal do come out of the funnels and are thrown a considerable distance. I have seen a number of fires started in that way. Now is it not possible to improve the spark-arresting appliances that are on the New South Wales railways to effectually prevent the escape of large cinders which cause numerous bush fires every summer? The danger of bush fires from this cause is one of the big disadvantages that the landowner who lives adjacent to the railway line has to put up with at the present time. I submit to the Commission specific cases showing refusal by the Railway Commissioners to acknowledge losses incurred in this way.

2449. Another matter that I have to bring before your notice is in connection with the departmental coal hoppers which are engaged in loading coal at Port Kembla. What applies in this respect to Port Kembla applies, I understand, to any other centre where the same work is undertaken. To illustrate my point I will read a letter from the secretary of the Illawarra Chamber of Commerce and Industry, Wollongong, of 7th August, 1923:—"Your letter of the 30th ultimo reached me when I was in the throes of influenza, so you must excuse me for not writing you before. The discharge capacity of Government coal trucks at the loading jetty is 25 to 26 trucks per hour, and the average load per truck is from 9½ to 10 tons. The discharge capacity of private coal trucks at the loading jetty is 60 per hour, and the average load is 8½ tons. The trouble with the Government waggons is the doors; they are not so easily manipulated as the privately-owned waggons. The Government waggon known as the Ritchie waggon is the best, and forty waggons per hour have been discharged at the loading jetty. It is a wonder that the Government do not make their doors to suit the Port Kembla trade, which is vastly increasing, as the same door would suit Newcastle and Sydney. (Signed) H. V. Lambath."

2450. Sir SAM FAY: The door referred to there is the hopper door?—Yes; it cannot be manipulated quickly, and brings about congestion and serious delay in the loading of ships with coal at the Port Kembla jetty.

2451-2. Is the capacity of the departmental trucks the same?—No, its capacity is 9½ to 10 tons. But they can only unload 26 per hour, which would be about 260 tons per hour. In the case of the private truck the capacity is 8½ tons, and the loading rate is 60 per hour, which is just on 500 tons per hour. Nearly double the quantity per hour can be unloaded from the privately-owned trucks than can be unloaded from the departmental trucks. In support of that letter I will refer to a letter from Mr. Henry R. Lee, of Port Kembla, dated 4th August, 1923, wherein he states:

"The privately-owned hoppers are much more convenient than those owned by the Government, principally in respect of the doors. In each case it is a simple matter to release the bottom doors, but whereas one man can readily close and fasten the doors of the privately-owned hoppers, it takes three men with tackle to close the doors of the Government hoppers. At the loading jetty controlled by the Public Works Department at Port Kembla it is the custom to pull up the doors of the Government hoppers by using the loco." That accounts for the slowness in the unloading, which is a serious handicap to the industry down there. It means delay in shipping, it prevents the quick loading of coal, and the matter is one which we think should have your investigation.

2453. Does that apply to Sydney as well?—Yes.

2454. Are the methods of loading at Sydney the same as at Port Kembla?—Yes, by crane.

2455. Another matter I have to refer to you finds me in doubt whether it is really a matter over which you have jurisdiction. It is in connection with the departmental

method of dealing with sleeper-cutters. In my opinion the Railway Department adopts a very unfair attitude towards these men who are working in the bush on contract cutting sleepers. From time to time the department discontinues buying sleepers at certain sidings. The men are out in the bush cutting sleepers, and they do not know that buying has been suspended, and eventually they deliver a lot of sleepers to the railway station or siding only to find that the department is not taking them. That inflicts great hardship on these men who are living in the bush with their families. To illustrate my point I will quote a wire received on the matter from Dubbo:

"Re sleepers, Mogriguy. Payment badly needed, men in distress, please try get settlement passed."

I will also read a letter on the same matter from Mr. John Wheaton, storekeeper, of Eumungerie, dated 6th October, 1922:

"I would be pleased if you could let me know where to write for particulars regarding the sleeper-cutting industry. There are a number of sleeper-cutters both here and Mogriguy; some are waiting for a pass for their sleepers and others have been passed and they have received no money. In some instances they have been waiting as long as three months. The position is now, that unless they can get something definite their credit will be stopped at once, and we cannot see how some of these people are really going to exist. As this matter is very urgent, I will esteem it a favour if you can do something, or let me know what to do, at once."

2456. Sir VINCENT RAVEN: Are they cutting on contract?—Yes.

2457. Not on speculation?—No, they are cutting on a definite understanding with the department of so much per sleeper. They deliver the sleepers to the railway siding and then a departmental officer comes along and passes the sleepers and grants payment on what they call the sleeper pass.

2458. How is it they do not get paid?—The trouble is that the men out in the bush deliver the sleepers from time to time—some of them have carters delivering—the timber passer comes along, say, to-day, and he is not expected back for three weeks or a month, the periods between his visits vary at different times, and in the meantime he does not tell them that he is not coming back; he does not know himself when he will be coming back, and the men go on delivering their sleepers and stacking them in their various heaps; a fortnight elapses, and the passer has not come along; they do not take notice of that, because sometimes he does not come along until a month has passed; so they go on waiting for a month, and at the end of the month they have a considerable quantity stacked and are absolutely in need of payment for their work. But when they come to make inquiries by wiring to some of us in Sydney they find out that buying has been suspended on that line or at that particular siding, and the result then is that they have got the sleepers there, their labour has been expended, and they are getting no return for their labour, because the Railway Department have suspended buying sleepers for the time being. My suggestion is that these men should have a reasonable notice of suspension of purchase of sleepers by the department, or the passer should notify them that he is not going to come back for six months, or whatever the time may be. The Railway Department has to depend upon these men for sleepers, and it means starvation to the men if they are left with a month's work or two months' work on their hands.

2459. WITNESS: And while I am on the subject of giving fair notice, I might refer to the practice obtaining in the Railway Department in regard to giving notice to officers who are about to be transferred. Station-masters and railway officers find that the notice given to them when they are due for transfer is extremely short. They are generally advised by wire, and have only a few days in which to pack up and transfer to another station. I think in all fairness to the employees we are justified in urging and advocating, particularly in regard to the country railway men, that these officers should get reasonable notice of transfer, especially when we know that the department has a big staff to draw upon, that it has plenty of relieving

men who could carry on until such time as these transferred men would have an opportunity of packing up and making ready for their transfer.

2460. Another matter I wish to bring under your notice is that of weighbridges. At the end of 1922 the Railway Commissioners intimated that they would no longer maintain the cart weighbridges which were in existence at the majority of the railway stations throughout the State. In addition to that they stated that they would not instal any more cart weighbridges in the country. The Farmers and Settlers' Association, of which I am the president, took up the matter and approached the Railway Commissioners with the view to try and induce them to instal weighbridges at those stations where it could be shown that such weighbridges could be justified, and to continue to maintain the existing weighbridges at the country stations. Eventually an agreement was come to whereby the farmers agreed to pay 3d. per ton for every ton of produce that they took over the weighbridge, and the Railway Commissioners agreed to instal weighbridges at all sidings where the farmers would be delivering 25,000 bags of wheat or more. Now, after having one year's experience, this position arises. The farmers find that it is very inconvenient to have to provide small change at every weighing. A large number of the farmers in the country do not carry small change with them when they are carting wheat and working with their teams. And in addition to that difficulty it is found that the system means that the railway officer in charge of the bridge has to carry a large amount of small change with him and has to do a large amount of book-keeping, and his books have to be audited and checked. It would greatly simplify matters if the department could come to an arrangement whereby it could charge 2d. or 3d. per ton on to the actual freight and allow that amount to be collected in one act, the department to maintain the bridges as they did in the past without making any specific charge for the actual weighing. What is required is that the produce be weighed and an increase of 2d. or 3d. be made in the freight to cover the cost of weighing. That would simplify matters and cut out a good deal of book-keeping, and eliminate the necessity for the railway clerk to carry with him a large amount of change. Further, when there is a large number of teams coming in to the station and every minute is valuable time to the people concerned, any arrangement which would minimise waste of time should, I think, be adopted. We would be pleased if you, gentlemen, would make inquiries in this direction on our behalf. We think the difficulty would be overcome if the Railway Commissioners were to charge, say, 3d. per ton extra for everything that went over the weighbridges in the State. I think from my knowledge of the Railway Act that the Commissioners cannot differentiate between persons, that if they charge one they must charge all and sundry; but I understand that it is only the farmers they have charged for their produce that has gone over the weighbridges. The farmers were under the impression that the Commissioners were going to make a charge on everything that went over the weighbridges, including the weighbridge at Darling Harbour, which is there for the use of the general public. The farmers think that it is advisable that the charge for weighing should be eliminated and that a small extra charge per ton should be made on all users of the weighbridge, so that all may be on an equal footing.

2461. Another matter I wish to bring before you in connection with railway construction. Under the system at present adopted difficulties will occur in the future, and those difficulties will show the want of foresight on the part of the engineers when laying out certain new lines. I am referring particularly to the Dubbo-Coonamable line, which was built a considerable number of years back. What I am stating applies to practically all sidings, but I will refer to one in particular. In constructing the railway platform and the loading dump, provision has only been allowed for two sets of rails between them. In other words, it is only a siding. When the time

Witness—H. V. C. Thorby, 1 August, 1924.

comes to make it necessary that a crossing should be put in, that a third set of rails be put down for crossing purposes, it will mean that the station will have to be pulled down, or the loading dump shifted out 10 or 12 feet.

2461A. Sir SAM FAY: Are you referring to when the time comes for doubling the line throughout?—No, not for duplicating. At present there are only two sets of rails, the platform is here, and the loading dump is there (*illustrating*). There is no room for a loop. If that loading dump had been kept out sufficiently wide—that is, if the rails had been laid an extra 12 or 15 feet apart—the loop could have been put in between them when the time arrived for that facility to be provided, and that would have saved the expense of having to shift the whole dump or the railway station. At several of these stations the time has already arrived when they will have to be converted into stations for crossing purposes, particularly so far as the wheat season is concerned. The particular station I refer you to is Armatree.

2462. WITNESS: I might refer to another matter, and that is the fact that the Railway Commissioners here have a Publicity Officer. At the same time I wish to state that the travelling public have not been acquainted with the facilities that the Railway Department offers. What I am referring to particularly is the completion of the Dubbo-Werris Creek line. It had been completed six months when an intending passenger made application in Brisbane for information as to travelling across that line. But no knowledge whatever was obtainable of the fact that that line was open for traffic. I do not think that you can blame the Queensland railway authorities for that. Personally, I contend it was short-sightedness on the part of our own authorities in not having used every endeavour to attract passengers to travel by that line as soon as it was completed. As far as I can ascertain no intimation was given to the Queensland authorities that that line was completed. If the Queensland authorities should be to blame I withdraw my remarks concerning the laxity of our own Railway Department. I produce statements referring to the work that was done by the railway officers and station-masters previous to the last tour of the Railway Commissioners, which it is contended was work that they should not have been called upon to do. It is merely titivating the premises without serving any great purpose.

2463. The last matter I have to deal with is one which may not come under your jurisdiction. You are investigating the whole of the working conditions of the New South Wales railways, and one of the hampering matters that we have to put up with in this State is that the neighbouring States have a different railway gauge to ours.

2464. Sir SAM FAY: We have no reference to the gauge question; that is a matter we have no right to deal with, and we could not do any good by taking evidence on that matter. We have no authority to make a suggestion even on that question?—What I meant to point out was this: I want to point out that although ours is the recognised standard gauge, our Railway Department is suffering from the fact that there is a break of gauge at the borders of this State. I thought you gentlemen might be able to make a recommendation on the matter.

2465. We cannot. That question has not been referred to us. I would like to put a question to you—the same question that we put to Dr. Kater. With regard to the possibility of levying so much per week for a given number of years on land adjoining a new railway, what would you say as to that?—In certain districts that would be acceptable. In other districts you might find a certain amount of opposition. In the districts where the large grazing holdings are you would find, in the great majority of instances, that Dr. Kater's objection would be a reasonable objection. Those people with large holdings already have to suffer a fairly heavy Federal land tax.

2466. But they have got no railway?—In many cases they have a railway.

2467. Then they would not want a new one. I am putting the suggestion to you that the man who has no railway and who is already paying the Federal land tax would be better off with a railway, and I am asking you whether he would or would not be prepared to pay something for getting the railway facility?—We went very fully into that phase when we were considering the placing of evidence before the Public Works Committee on the question of a railway from Maryvale to Sandy Hollow. That was a decentralising railway, which was recommended by the Decentralisation Committee. In submitting the question to the whole of the landowners along that proposed line, the question whether they would be prepared to contribute so much per annum for a certain number of years towards the interest or the loss that might be sustained on the running of that line, the reply was almost unanimously in the affirmative—that is, that they were prepared to contribute a certain amount per annum. The suggestion that we put forward was that as the farm got further back from the siding it would pay a less amount per acre; that a farm within 5 miles would pay a few pence, that a farm within 10 miles would pay less, that a farm within 15 miles would pay less still, and that a farm beyond the 15 miles limit should not be asked to contribute. It is unprofitable to grow wheat over 15 miles from a railway line at the present time, even where you have a good road. So far as grazing is concerned, the railway line would not be of any great benefit to a grazier, because you can cart a wool clip almost as cheaply 100 miles as you can 15. In the districts that would become agricultural I do not think any opposition would be taken to the levying of a rate on the landowners who would be benefited by the construction of a new railway line.

2468. WITNESS: I have quite a number of cases before me where landowners have complained bitterly of the fact that under the present law, when a new line is sanctioned, the whole of the land necessary for that railway line is resumed without any compensation to the landowner whose property the line goes through. The argument is that the line may depreciate a property by £300, but on the other hand improves it and enhances its value more than it depreciates it. But in many localities you will find two landowners, one of whom has been benefited by the railway while the other has derived no benefit at all. Let me give you one specific instance. In this particular instance I have in mind the siding is erected right opposite to one man's homestead; the railway line does not take a fraction of land from him, and it does not interfere with his property in any shape or form, and he gets the maximum of benefit by having a siding near his homestead. Now his neighbour, who is a couple of miles away, has the railway coming into his property and running through his property, and he is very little closer to that siding than he was to the old township, and he loses 25 acres of land, and has his cultivation paddocks cut up into unshapely areas, and gets no compensation whatever. The contention is that if a charge was made on all the land adjacent to new lines there would be created a fund from which compensation could be paid towards recouping any loss that might be sustained. Personally, I would strongly support the introduction of such a scheme as that, and I am stating that having full knowledge of the attitude of the landowners between Maryvale and Gulgong, a distance of 60 miles.

2469. Sir SAM FAY: You are referring to a levy to make up for a loss; I was referring to a levy to meet the cost of making the railway, spread over a number of years?—We did not specify what the money would be used for; we said it would go to make up the interest on the capital cost of the loan, or to make up the loss on the running of the line. The amount suggested was 4d. for the first 5 miles, 3d. for 7 or 8 miles, and then 2d. and then 1d. That would bring in a fairly considerable sum of money.

(At 3.45 p.m. the Commission adjourned to 10.45 a.m. on Tuesday, 5th August, 1924.)

## FIFTEENTH DAY.

TUESDAY, 5 AUGUST, 1924.

(Held at Chief Secretary's Building, Macquarie-street, Sydney.)

## COMMISSIONER :

Sir SAM FAY.

Sir VINCENT L. RAVEN.

ERNEST EDWARD LUCY, Chief Mechanical Engineer, New South Wales Railways, sworn, and examined as under:—

2470. Sir VINCENT RAVEN: You are the Chief Mechanical Engineer of the New South Wales Railways?—Yes.

2471. You are responsible for all the rolling-stock—locomotives, carriages, and waggons, their maintenance and repair?—Yes.

2472. And there is nobody to interfere with your control at all. You are responsible entirely to the Railway Commissioners?—Yes.

2473. You have given me a very full description of the organization of your workshops. There are a few questions I would like to ask you. With reference to locomotives, I have a statement here as to the numbers which you had from 1913 to 1923, and 1923 I see you had 1,341 locomotives, but you have given to me 1,391. From the 1,391 I have taken off thirty-four, which are practically out of use, and twenty which are duplicate stock. That brings the total from 1,391 down to 1,337 that you have in use—effective locomotives; but this statement differs from the Commissioners' report, which gives 1,341. Can you explain what is this difference of the four?—At the moment, no.

2474. You might just look into that?—The Chief Commissioner's report ended on the 30th June, 1923, and my statement, I think, goes to the 30th April, 1924. That probably accounts for the difference of the four engines.

2475. The report I am talking about is 1923?—This figure is at 30th April, 1924.

2476. But I am not talking about 1924. However, I think you had better look into it and let us have your own explanation. There is not a great deal in it at the moment; but still I would like to have that cleared up. There is an increase in engines from 1913 to 1923 of 34.37 per cent., and there is an increase in miles open for traffic of 35.31 per cent. Has this increase in the number of engines been paid out of capital or of revenue?—Out of capital.

2477. Then the increase in the capital represented in locomotives is somewhere about equal to the increase in miles open for traffic?—Yes.

2478. I have got a statement here which shows me all the different classes of engines which you have got, and they total up to thirty-nine?—Yes.

2479. Are the engines exactly similar and the work interchangeable?—No.

2480. So they might be multiplied again by a good many practically different classes?—Yes.

2481. Would you be able to look into that and tell me to what extent they vary in the different classes?—Yes.

2482. I do not expect you to do it now, but you might do it for me. Now, the total capital value of those locomotives, as given to me, is £7,139,868. You agree with that?—Yes.

2483. Now, I suppose those locomotives wear out or get obsolescent at some time or other?—A considerable number of them are old-fashioned and obsolete types.

2484. But they will wear out or get obsolete at some time or other?—Yes.

2485. Have you got in your mind any average life which you should put on a locomotive?—I think that an ideal life of a locomotive should not exceed thirty years.

2486. If you look at thirty years' life for your engines as they are numbered to-day, you would have to build forty-five engines a year to keep up the stock?—Yes.

2487. And if your capital had to be renewed in thirty years you would have to spend every year £237,996. If that arithmetic is right, do you agree with that?—I do.

2488. You send in an estimate every year for what you expect to spend during the coming year. When do you send that in?—As a rule, about April or May of the year in front of or in advance of the year which will begin on 1st July.

2489. That is to say, in April or May of 1923 you send in an estimate of the work you will do in 1923-1924, commencing 1st July?—That is so.

2490. Now, how do you send those estimates in;—are they divided in any way;—we will take the locomotives first?—They are sent in ranged in items giving the heading for which particular sums are required in detail, and submitted by me to the Chief Accountant.

2491. You have not got a statement showing how they are sent in?—I think I have one here. (*Statement handed to Sir Vincent Raven.*) I have pencilled on the top of that statement the date the estimates were passed.

2492. In this return that you have shown me—I do not for a moment want to know anything about the top part, which refers to locomotive drivers and firemen's wages, but I see that you have got here an estimate for wages and material, £1,688,801, and for new boilers, &c., £221,700?—Yes.

2493. You have nothing down here for new engines at all?—No.

2494. Did you not expect to build any new engines that year?—Not on that account.

2495. Not for renewals?—Our renewals are charged to working expenses.

2496. But this is all your expenditure, is it not, as far as repairs to locomotives is concerned?—Yes.

2497. There is no other estimate shown here for locomotives outside those two figures?—No.

2498. Therefore, you did not estimate for building any new locomotives that year?—No.

2499. I suppose you do not always get what you ask for?—No.

2500. You say that your estimate goes to the accountant?—Yes, the Chief Accountant.

2501. Do you hear anything more about it until you are advised as to what the Treasury have agreed to?—Yes, sometimes the Chief Commissioner will call us down; that is, the heads of departments, and give certain directions with regard to sums of money.

2502. He consults you before the amount that you have asked for is reduced?—Yes, he holds meetings of heads of branches for that purpose.

2503. But he does consult you before the amount of money you have asked for is reduced, and you agree to the reduction?—Yes.

2504. I see in this return that you have handed me that with regard to new boilers, &c., you asked for £221,000, and you were allowed to spend £175,720?—Quite correct.

2505. Will you first of all tell me what you did really include. I do not mean in every detail, but what you did really include in that £221,000 which you asked for?—I had in mind to re-boiler and set with super-heaters a considerable number of locomotives. As a matter of fact, last year I built 102 new boilers.

2506. I understand that the Chief Commissioner said you could not spend that money. Do you know why he

Witness—E. E. Lucy, 5 August, 1924.

would say that?—I should think because the estimates were passed so late. I think I have put the details in pencil at the top of that statement. The estimates were passed so late that we could not possibly spend it.

2507. But if you had the estimates passed in time would there have been any difficulty in your spending the money that you asked for?—No.

2507A. As a matter of fact, you did spend that year, in maintenance, £1,688,701?—Yes.

2508. Can you tell me what proportion of the work you do at Eveleigh, Honeysuckle, and the other factories?—I think a fair proportion would be to set Eveleigh at 600 output, Newcastle at sixty output, and Lismore at ten output. That would be about the proportion of 600, sixty, and ten.

2509. That is, 670 engines a year?—That is approximately correct.

2510. That is the percentage?—No, it would be heavy repairs—600 engines heavily repaired at Eveleigh, sixty at Newcastle, and ten at Lismore.

2511. Of course, it is quite easy to work out the percentage of repairs which are done at Eveleigh, Honeysuckle, Lismore, and out stations, and there are a large number of engines which are repaired outside Eveleigh works?—Yes.

2512. And even outside the Honeysuckle works?—Yes.

2513. In your opinion is the decentralisation of the repairs to locomotives in that way a costly business?—Undoubtedly.

2514. I have got here a statement which shows the cost of maintenance of your locomotives, as compared with other railways, and it shows that your costs are very high. Can you give me any explanation with regard to that?—I think so—yes, based on the size of the engines, the large size of our engines, and on the work that they perform. As a matter of fact I have handed in a seven-page statement.

2515. I have that, but take your engines that have been repaired in 1923. They show £1,246, the average cost per locomotive?—Yes.

2516. If you reduce that to compare it with the English railways, regarding your labour costs as 100 per cent. and material 35 per cent. higher than in England, your comparison shows £721, as, for instance, against the Great Western £518. That is a big difference?—Yes.

2517. And I presume that you will agree that on the Great Western Railway they have plenty of large engines?—I think that average tractive power of the Great Western Railway engines would be considerably below New South Wales.

2518. You will agree that they have a large number of very big engines?—Yes.

2519. You will agree that on the London and North-Eastern Railway they have a very large number of very big engines?—Yes; still I think the proportion would be less than New South Wales.

2520. We will come to that. You will agree that they have a large number of very big engines?—Yes.

2521. The difference between their cost and yours is £506 in engines for the London and North-Eastern Railway and £721 for the New South Wales railways, based on the same price for wages and material, and you must also remember when you are comparing, that in the one case they are beautifully painted, and in the other case they are not painted at all, and there is some cost attached to that. I gather from what you say that you attach some importance to the tractive power of the locomotives?—Yes.

2522. I have worked this out carefully, because you used the same argument in connection with your coal costs?—That is so.

2523. But if you use that argument in connection with the maintenance of locomotives, even supposing the tractive effort on the North-Eastern Railway, which I have as 20,120 against your 23,751—the difference worked out on that basis, which I do not altogether agree with—

but assuming that your assumption is correct, then you are £721 as against £597 for the London and North Eastern. If that assumption was correct, you are still very high?—Yes.

2523A. Apparently you do not give me any further explanation than that, but is it not expensive to do so much of your repairs out at your running sheds?—Undoubtedly.

2524. Is not that part of the reason?—Part of it, yes.

2525. Then the layout of your Eveleigh shops is not as good as you would desire?—It is not.

2526. In fact, you are building new shops?—Yes, at Chullora.

2527. And you have got a boiler-shop nearly completed?—Yes.

2528. When you move there, have you not given the Commissioner any hopes of you being able to reduce your expenditure?—Yes.

2529. Is he not going to expect something from those new shops?—Yes.

2530. Are those not partly reasons for the high costs?—To some extent, but I do not admit that our costs are excessive, having regard to the size of our engines and the curvatures and grades of our lines.

2531. You are much higher than any of the other railways in Australia?—Yes.

2532. And you give the same reason for that?—No.

2533. I suppose you will agree that 1914 was a year where nothing special took place?—It was just before the war; things were normal.

2534. The average cost per engine in stock was £575 for maintenance then, as against your average cost to-day of £1,246. Now, I suppose, the grades and curves were the same in 1914 as they are to-day?—Yes.

2535. It is not since then that you have had all these very powerful engines?—Since then we have had no small engines. All the engines we have had have been large ones, with the exception, I think, of ten suburban engines—I am not sure of that number.

2536. I see that you only scrapped seventy-five locomotives, including these thirty-four and twenty which I have taken off—that is, fifty-four; that leaves only twenty-one engines which have been scrapped outside that lot in those years from 1914 to 1923?—Yes.

2537. So you see there is not a great deal of difference between the tractive effort in 1914 and to-day?—I think there is a considerable difference in the average tractive effort. I will send down particulars if you wish.

2538. Yes, it will be quite easy to get that out. However, my point really is this. Adding to that £575 as against £1,246, the increased cost of wages and material as given by yourself, brings the average cost of the engines in 1914 to £961 as against your £1,246 to-day?—Yes.

2539. You have not improved in that time?—Since 1914 all the engines which we have purchased or manufactured ourselves have been of the large type, with tractive force somewhere in the neighbourhood of 33,000 lb.

2540. I do not think their tractive force has a great deal to do with their repairs, if I may say so. However, I do not want to argue the matter at all now; all I want is to ask you questions. You will remember that we are only talking about repairs, and most of these engines after they were built would require very little repair for the first few years of their life?—Yes.

2541. And I put it to you that there is a great deal of difference between these figures in 1914 and the figures to-day?—Yes.

2542. It is £285 per engine in stock worse than you were in 1914?—Yes; I think that is due to the continued increase in the size of the engine, the greater number of wheels, tyres, axles, the larger tender, with the two pairs of axles, instead of the three single axles.

2543. I notice that you manufacture a great number of special articles in your own works. Are you quite satisfied that it is more economical to manufacture these yourself than to purchase them outside?—Quite. I have

sent in a statement to you, giving the comparative prices or costs, on articles made by us and articles purchased by the stores.

2544. What overhead charges did you put against those manufactured articles yourself?—All the wages and holidays, and other expenses which are not directly chargeable—all indirect charges are included as overhead.

2545. You are satisfied that all the overhead charges are debited to the special manufactures?—Yes.

2546. I suppose your accountant would do that?—Yes.

2547. Then, if you were to purchase more outside, your cost would be even higher than it is to-day?—It would.

2548. To that extent you would compare favourably with the English railways, because we purchase a great deal outside. To that extent you ought to be more favourably situated?—Yes, but I would like to point out that our manufactured costs of parts are lower than those for imported parts purchased from the same sources as by English railways, only because we have to pay for packing, shipping, insurance, landing costs, and duty—the last alone amounts to 30 per cent. usually.

2549. And yet you show so much worse?—We may in the total sum, but I have worked out by comparisons here, and we show very well.

2550. I will carefully look over that, but I do not agree with those arguments at all. I do not mind it going in, but it is an extravagant comparison altogether. It relies so much on assumptions of various kinds, and nothing I have here is based on any kind of assumption. They are absolute figures which are given regularly.

2550A. I noticed in going round your shops you use no standard gauges?—That is so, with the exception of our motor-car department.

2551. I suppose under those conditions there are very few parts of your locomotives which are interchangeable?—Very few.

2552. I notice that you manufacture all your springs yourselves in the shop?—Yes.

2553. Are you satisfied with that?—Yes.

2554. I have here a statement of the number of springs broken in 1923 on locomotives, and it comes to a total of 2,912—that is, for a period of ten months, from June to March. That appears to me to be an extraordinary number of springs to break, and I would like to know what you have to say about that?—I have no other railways figures of comparison by which I could make comparisons.

2555. Do you think that is a large number or not?—I think the number of broken springs for two classes of our engines is high, but for all the other classes the performance is good.

2556. 2,912 in ten months?—May I ask a question with regard to that? If the springs are laminated, or laminated and coil springs—

2557. What does it matter about the springs? You would not put a class of spring on an engine that you would expect to break, whether it was laminated or spiral.

2558. Therefore, I do not really see what difference it makes. It is a spring and it is designed by you?—Yes.

2559. And you are entirely responsible for it, and you put on a spring which is most suitable for the locomotive?—Yes.

2560. Therefore it is immaterial whether it is a spiral or a laminated spring?—My point is this: We have groups of coil springs which are in some cases in nests of four to an axle box. If one of those springs break, it is a broken spring. Therefore on that basis four springs which may break against one laminated are in that same axle-box.

2561. But you would not allow an engine to run with a broken spring, no matter whether it was one of a nest of four or whether it was by itself?—I would consider a broken spring out of four in a group as no reason for putting the engine off the road, or to even tell the driver to run at a slower speed; but I would see that it was put in at the next running shed.

28910—G

2562. That is my point; you would not allow an engine to run with a broken spring. I presume that what you mean is that it would not be so dangerous as if some other spring had broken, but still it is a broken spring; it is a defect in the design?—I do not think so.

2563. However, it does not appear to you to be a large quantity?—No.

2564. Machinery in your shops at Eveleigh appears to be fairly satisfactory?—Yes.

2565. However, I notice that the machinery, taking your capital value, has had as much spent on it as represents 8½ per cent, which appears as if you had spent quite a sufficient sum on the upkeep of your machinery, and it appeared to be quite up to date. Therefore, the cost of your high repair will not be in connection with the machinery in your works at all. Can you tell me what proportion of your engines are superheated?—I have 437 superheated engines.

2566. That is about 30 per cent. of your engines superheated?—That is so.

2567. Can you tell me how many different kinds of superheaters you have?—Three.

2568. Have you tried any other kinds except those three?—Yes, we tried a fourth some years ago, but abandoned it.

2569. Did you put many in?—I think there were about eighty put in. They were Vauclain smoke-box heaters.

2570. And they were unsatisfactory, and you took them out?—Yes.

2571. And you have three different kinds to-day?—Yes—Schmidt, Robinson, and one of my own.

2572. And the only other one you tried was a Vauclain. Was it a complete superheater?—No, it had no fire-tube elements at all. It was simply a header from the steam-pipes, a header on the cylinder.

2573. How long ago do you say it was since you took them out?—Some seven or eight years ago.

2574. Are you satisfied with the work of your superheaters?—Quite.

2575. Do you get any complaints from the men in connection with them?—Not now. In the old days I had some considerable trouble, because we had the damper system. Then we did away with the damper system and adopted the Raven air circulatory system. That is automatic, and the drivers have no means of spoiling their superheat by shutting dampers or opening them when they should not.

2576. What is the result which you expect mostly to get from these superheaters?—I actually get 10 per cent. increased load.

2577. Increased power?—Yes, our train regulations provide for that.

2578. Did you expect any economy in coal consumption?—Yes. I have instances where we have measured the coal as between Junee and Albury on expresses, with the result between classes of engines exactly similar, excepting one is saturated and the other is superheated, and the economy is 20 per cent.

2579. You have a large number of failures. Can you give me any explanation with regard to those?—Water trouble is one of the main causes, bringing about leakage of tubes of superheater elements, and injector failures, and failures through priming.

2580. I suppose you have your water carefully analysed in an endeavour to improve it?—Yes.

2581. What have you done in that direction?—We have installed a considerable number of Desrumaux water softeners and Kennicotts', and also installed Desrumaux system water hardeners, but the trouble is that most of our waters contain chlorides.

2582. I suppose you have improved your water to some extent?—Undoubtedly.

2583. All railways have a certain amount of trouble with water?—I believe that is so.

2584. And it has to be got over by treating it by chemical means?—Yes.

Witness—E. E. Lucy, 5 August, 1924.

2585. Is that the only explanation you can give with regard to the failures?—We have, by carefully following up these cases of failure, considerably reduced the number of them.

2586. Let me give you some comparisons in connection with these failures, and I think you will see there is something rather extraordinary about them. An engine failure with you is, if a passenger train runs five minutes late, due to the engine, or if a goods train is running ten minutes late, due to the engine. Taking the year 1923, your engines ran 4,225 miles for every failure. I have got the failures on the London and North-eastern Railway for the same year, the only difference being that in every case—goods or passenger train or whatever it is—if it is five minutes late it is an engine failure, and in your mileage is included light and assistant. In the train mileage on the London and North-eastern there is no light or assistant charged. Therefore, to the extent of it being five minutes, and losing the light and assistant mileage, that is all in favour of the New South Wales railways. Now, the failures, as I said in your case, were one every 4,225 miles, and in the other case they are one every 40,000. That is such a remarkable difference that some explanation really is required outside the question of water. In New South Wales, any passenger train five minutes late, or goods train ten minutes late at destination, or even at intermediate station, by locomotive causes, is deemed an engine failure, and generally some part of the engine is blamed. It is, however, known that frequently mismanagement of engine is the real fact. Over 100,000 miles are run by New South Wales engines per failure causing engine to be changed for another engine.

2586a.—With regard to your coal, will you tell me if you have any system by which the coal is weighed when it is used in the locomotives?—No, except for trial or special circumstances.

2587. Then who is responsible for the supply of coal?—The Comptroller of Stores.

2588. He is responsible for checking it?—For checking it, yes, in the main.

2589. How does he satisfy himself as to the amount of coal you have burnt, and how it is used? Is there any means of checking it?—He has a complete check on the weight of the coal that goes to every steam shed, and there the Comptroller's responsibility ends.

2590. He simply provides you with coal?—Yes, the use of it is my responsibility.

2591. Then you are responsible for checking it?—Yes.

2592. What means have you got of checking the coal?—I have the weighing, checking the weighing done by the Traffic Branch.

2593. The coal is simply shovelled onto the locomotives?—Yes. We have only the estimate of the fuel man who puts the coal on the tender as to how much he has put on.

2594. Then it simply goes?—That is so.

2595. You have so much coal, and that coal in course of time disappears, and you assume it is burnt by locomotives?—Yes.

2596. Now, your coal consumption is high, is it not?—I do not think it is high, having regard to the work that the engines do.

2597. But it is high?—It would appear high compared with English figures.

2598. But, first of all, it is high as compared with any of the other railways in Australia. It is very high as compared with any of the railways in Great Britain. Of course, you may be able to explain why it is high, but, in the first place, it is high?—Yes.

2599. The coal consumption is 85 lb. per mile, as against Victoria, 73, Queensland 60, New Zealand 56, and the whole of the British railways 54. Therefore it is high?—It is higher than the British railways, certainly.

2600. Very well, then. It is higher than the other railways in Australia as well as the British railways?—Yes.

2601. I must ask you how you explain that?—I will explain it by the larger tractive effort, the difficult roads that we have, both with regard to grades and to curves.

2602. But I presume the loads are arranged to suit the gradients and the curves?—Yes.

2603. We will take, first of all, your tractive capacity, to which you apparently attach importance, and, as I say, I have worked out that if the London and North-eastern tractive effort was similar to yours (23,751), then the coal consumption, according to your argument, would be increased from 58.05 to 68.53 lb. per engine mile, and the difference still is great—68.53 against your 85.18—which is bringing the tractive effort up to the tractive effort of your railways?—Yes.

2604. Of course, from that point of view a good deal of argument might be brought into it, but, taking your view, that is how it would present itself?—Yes.

2605. However, you have prepared in your memorandum which has been sent to me the coal consumption of the New South Wales railways compared with what you consider to be a corresponding area or railway in the United States of America, the eastern district?—Yes.

2606. Now I have the figures for 1922 and 1923, and I have taken the figures of 1923 and compared the consumption of coal per thousand gross ton miles hauled in both cases, and that seems to be a standard that nobody could grumble at. Now, the average coal consumption of the New South Wales railways per 1,000 gross ton miles, including engine and tender in both cases, is 290.3 lb.; and for the eastern district of the United States of America, 159. That is taking a railway which you yourself have selected, and taking it on a common basis which nobody could help agreeing with. There is no question of tractive effort and what it does?—Yes.

2607. Can you tell me what attention is given to engine-cleaning, the cleaning of your locomotives. What is your practice?—Our passenger engines are kept in fairly clean condition, but the goods engines are not kept clean.

2608. And that is your system?—That is our system based on the need for economy.

2609. I was going to ask you that. What do you calculate you save by this system of not cleaning your engines?—I would say certainly not less than £200,000 a year, and that is a very conservative estimate.

2610. Is there anything on the other side of the balance-sheet;—is an engine that is kept—I think you will forgive me for saying—in the dirty condition in which yours are kept, just as easily repaired, and are they as well looked after from the maintenance aspect as if they were well cleaned?—I do not think if they were well cleaned that we would get another mile out of them.

2611. You would not get any less failures?—I think not.

2612. You calculate you save £200,000 a year by having dirty engines?—That is so.

2613. You do not paint your engines at all?—We give them a coat of Black Japan.

2614. But you do not do what people usually call painting?—No.

2615. Or what a railway chief mechanical engineer usually calls painting?—No.

2616. What do you save by that?—I can paint an engine and tender here for about £45.

2617. What do you save by not painting your engines?—I just save that £45, and the time the engine would have to stand for the paint to dry, that is all.

2618. I suppose your engines, at any rate, would not come in for a heavy repair oftener than once every two years?—No.

2619. Would you think that you saved £20,000 a year by it—by the non-painting?—Yes, about that.

2620. I suppose you would say that if you painted them you would have to keep them clean?—I do.

2621. And that would hurt you?—The putting £45 worth of paint on an engine and then letting it go to destruction in a very short period.

2622. You have a bonus system in your workshops. To what extent is that carried out?—From memory it is about 14 per cent., but I have a return compiled giving the exact figures.

2623. I notice here on an extract I have got of a board meeting in which the Chief Commissioner draws your attention to the fact that you have only 8.6 per cent. This is in 1923, on your locomotive side. Do you agree that those figures are correct?—Yes.

2624. That is much less than 14 per cent.?—The bonus is an increasing thing, slowly increasing.

2625. You do not do so much on the carriage side as on the locomotive side?—Not quite, but we are increasing there.

2626. That did not exist in 1914, and to that extent things ought to have got better?—Yes.

2627. You have got a good increase in machines in your shop since 1913?—Yes.

2628. There are a great many more new machines installed?—Yes.

2629. That ought to have reduced the cost of repairs?—Yes.

2630. And you hope to be able to increase the number of men working on the bonus system?—Yes.

2631. There is a large percentage in your foundry working on bonus?—There is where the greatest quantity of bonus work is done.

2632. Do you contend that you do your work very cheaply in your foundry?—Yes, cheaper than anywhere else in New South Wales.

2633. I notice you work on a unit system. Can you tell me what this unit system is based upon?—It is based on the known amount of work of various kinds and descriptions that can be done by the average workman within a given period of time, the times being different for the locomotive, for the carriage, and for the wagon sections.

2634. You have given me a statement here which is intended to represent the basis upon which you work, and it tells me here that one unit equals 160 hours of direct labour?—Yes, that is on the locomotive side.

2635. I am looking at the locomotives. I am dealing entirely with locomotives with you up to the present time. It looks to me a little complicated to carry out. Do you find it so?—No; as a system introductory to the cataloguing system such as was in use on the Great Western Railway, and I know is in use on the Pennsylvania Railway, I think it is a good system.

2636. Do you use it as a means to tell you whether you are getting improved work out of your shops in one period as compared with another?—Yes, output.

2637. That is to say, whether you are getting more work out of the men at one period than another?—That is what it does, precisely.

2638. When did you institute this?—I think it was the end of 1916, or the beginning of 1917.

2639. How did you determine the amount of work in direct labour which could be taken over those different portions of work connected with the locomotives?—By having it watched by men selected for the purpose and checked afterwards by the loco. works manager.

2640. And this statement here represents what he considered was a fair length of time?—In every case.

2641. And that was done in 1916 or 1917?—I say that from memory, but I am not sure of the date.

2642. Is it the same now as it was then?—The principle is the same.

2643. But I mean are those times the same;—is it still 160 hours direct labour one unit?—Yes. The time that constituted a unit was fixed at 160 man hours in 1917, and all the principal large units of work were assessed proportionately. The object of the unit system was to provide a means of checking the proportion of output to workmen's time, as, on account of the rapid variation in wages rates—since the war—actual cost was not a criterion.

2644. And that is carried out to-day as you commenced it?—Perhaps I may be permitted to correct a mistake. We did have some little difference in the exact number of hours to begin with as the unit, and after having had an investigation by our present Chief Accountant, the present hours were set as a standard. I think, from memory, that it was 150, and then went to 160.

2645. When was that change made, at the beginning?—No, about three years ago.

2646. You commenced this in 1917 and changed it in 1920?—Yes, the change was a small item.

2647. You say it was a small item to change from 150 to 160 hours?—Yes.

2648. Do you mean that before that the work was done in a less time than now?—No, it was on account of the computation, or the estimate of the job having been not quite correct enough. It was found by experience that it had to be amended.

2649. Then your unit before 1920 was not correct?—No, it was capable of amendment and was amended.

2650. Then you could not compare anything done under it to-day with anything done before 1920 because the basis has changed?—According to unit, no.

2651. But since 1920 it is the same; there has been no change?—As I said before, it looks to me a very complicated unit, but you are satisfied that it is not?—I am satisfied that it is not complicated. Of course, I admit that it is not the equal of the cataloguing system, but that takes years to systematise.

2652. Of course, you yourself are not responsible for getting out the amount of units in labour that had been carried out in your shop in any particular time?—I consider myself responsible.

2653. Of course, you are responsible for everything, but I mean you do not do it yourself?—No.

2654. Is it done by your accountant or by your foreman, or how is it carried out?—It is done by the sub-foreman first of all, the foreman next, the works manager's assistant, and then the locomotive works manager.

2655. It comes from the sub-foreman, who gives certain particulars to the foreman. Does he do anything himself?—He has a system of job cards, and a method of setting the workmen to their work, and the amount of work and the particular job which the workmen have to do. We have a system whereby the work to be done by any workman, such as, for instance, blacksmiths and strikers, is set forth on a card with the date and time, and on another card is recorded the fact that such a card has been issued to such workman or workmen. That is the sub-foreman's duty.

2656. The amount of work the man has done?—Yes, and he is also responsible for seeing that the man does his work properly and within a reasonable time.

2657. I would just like to get a little bit nearer the explanation of this, if I can. We might take it in this way. Here is a heavy repair for a "G. Hunslet." What does that mean?—That it was built by the Hunslet Company, Leeds.

2658. "Heavy repair to a G. Hunslet, 21½ units of direct labour." I understand that is a heavy repair. Of course, a heavy repair might not mean exactly the same to another G. Hunslet engine that came in?—No.

2659. It might be a little easier or it might be a little worse, but I suppose you take that as an average?—Yes.

2660. Now I suppose that that heavy repair will take perhaps two months?—At an out-station, yes. If it was done at Eveleigh or Honeysuckle it would take a lesser time.

2661. Does this unit of work apply in the same way at an out-station as to Eveleigh?—Yes.

2662. Although it takes a longer time at the out-station than at Eveleigh?—Yes.

2663. That does not sound quite right?—For this reason, that at Eveleigh and Honeysuckle the cranes are available for the purpose of de-wheeling an engine straight away, while at an out-station that work would have to be done by jacks and packing.

2664. I see, but you would not compare an out-station with Eveleigh or Eveleigh with an out-station?—No.

2665. I suppose you assume that the conditions are comparable, because you compare an out-station with an out-station and Eveleigh with Eveleigh, so I do not think there is much point in that?—No.

Witness—E. E. Lucy, 5 August, 1924.

2666. I am talking about the same place. You brought in another place. I say you would not compare Eveleigh with some other place?—No.

2666A. Therefore, taking Eveleigh, a G. Hunslet engine at one time would be different to the G. Hunslet engine at another time?—Yes.

2667. To that extent the units would not be comparable with the amount of work you have done?—No.

2668. Are there any supplementary units as well as that repair?—No. That should be the sum total of all the units performed on that engine.

2669. What are supplementary units for?—Supplementary units are to cover work involving alteration in design and special repairs of infrequent nature, such, for instance, as fitting of new cylinder.

2670. Then they are really in addition to a heavy, medium, or a light repair?—Yes.

2671. They are entirely separate?—Yes.

2672. These additional units here are not meant as additional to those?—No, but I see you have the erecting shop unit there.

2673. On this first page you show that a unit is 160 hours direct labour, and you show down here, for heavy repairs, medium, and light repairs, and supplementary units, what each of these are allowed in the number of units for the work done to repair the engines?—Yes.

2674. And I presume that if I take this heavy repair for any of the classes of engines?—A.C., C.G., Z 17, &c.—and I multiply 160 hours at 18.63, I get the number of units which it has taken to deal with that heavy repair?—That is so. That is the estimated amount of time it should take to make that repair.

2675. Now I see here that there is a class for supplementary units, and then I look on the next sheet, where there are additional units, and I see No. 1, and there are certain additional figures here. For instance, two cylinders removed, you have got 42 of the unit. That, of course, is nearly seventy hours direct labour?—Yes.

2676. Has that got to be added to this?—Yes, in case that engine had to have repairs supplementary to pulling the cylinder out.

2677. Therefore, for a heavy repair you will get nineteen units for that, if it had to have its cylinders removed?—Yes.

2678. And if it had one cylinder removed, you would get something for that? If it had any of these things done you would get those additions as shown in No. 1.?—Yes. They are precisely parallel with the system of some of the English railways.

2679. You call it a heavy repair?—Yes.

2680. But if it is a new ashpan, is not that part of a heavy repair?—It may be, but not necessarily.

2681. If an engine came in for a heavy repair and it had new tyres or a new ashpan, you would not call that part of a heavy repair?—Yes.

2682. You say you add this to your heavy repair?—Yes. Some engines come in for heavy repair. Their cylinders are firm in their frames and in good condition; nothing has to be done to them. Another engine comes in, whose ashpan has run over some object, or it may be that it is corroded, and it has to have a new ashpan.

2683. You do not call that part of a heavy repair?—Not necessarily.

2684. What is a heavy repair?—A heavy repair is the carrying out of repairs which locomotives require after having run the average maximum number of miles of its class.

2685. But I notice here, that, no matter whether it is a heavy repair or a light repair, if it does any of these things, it gets the same amount added to it?—Yes, the cataloguing system does the same.

2686. Are the stores under you or the Comptroller of Stores?—The Comptroller.

2687. Do you refer to any particular place when you say that?—Yes, more particularly at the store at Eveleigh and to the store at Newcastle, and the assembly room now in the works at Eveleigh. Those are under the Comptroller.

2688. Of course, the stores at your out-stations are not under the Comptroller?—No.

2689. You are talking now about stores in your workshops?—Yes, the assembly room or stores in which we have large quantities of material, manufactured for the use and repairing of locomotives.

2690. I am talking about your general stores. Is that under you or is it under the Comptroller?—Under the Comptroller.

2691. That is as far as your workshops are concerned?—That is so.

2692. Because, outside it is under you and not under the Comptroller?—That is so.

2693. But as far as your workshops are concerned, the stores are under the Comptroller?—Yes.

2694. How do you deal with the scrap which you have? You are continually making a large amount of scrap in your works. How do you deal with that?—Cast-iron scrap goes to the foundry, brass metal scrap goes to the foundry, white metal scrap goes to the metal shop, and some portions of the wrought iron and mild steel go to the forge to be piled and made into forged piled iron.

2695. I want to know generally how you deal with your scrap?—The rest is sold.

2696. Part of the scrap is used by yourself and part of it is sold?—That is right.

2697. The scrap which you use yourself, is that all weighed and debited to the particular shop or work that you are using it for?—Yes.

2698. Who does that?—The stores and the foundry.

2699. Your own store?—Yes.

2700. Under the Comptroller?—No.

2701. Have you any return sent you regularly of the amount of scrap that you have used or accumulated at different parts of your line?—Yes, I have that carefully kept.

2702. Who sells the scrap which you sell?—The Comptroller.

2703. Then really you hand it over to the Comptroller?—Yes.

2704. Part of the scrap you use yourself and part you hand over to the Comptroller?—You do not sell any of it?—No.

2705. Do you get a credit for the scrap which is handed over to him?—Yes.

2706. At the price he sells it at?—Yes.

2707. Have you got a statement as to the amount of scrap which is handed over to him?—I have no statement here with me, but I can get it.

2708. You get that regularly?—Yes.

2709. And the amount of credit which you get for it?—Yes.

2710. I am still keeping to locomotives for the moment. All the running-shed work and locomotive work outside, of course, is under you, but directly under the Loco. Superintendent?—That is so.

2711. Is he responsible for the repairs?—Yes, the running-shed repairs.

2712. And the supervision of all the locomotives in those various divisions that you have shown here?—Yes.

2713. Then it would be better to question him upon any detail of the work carried out there?—I think I can answer most of the questions.

2714. Still, he is the man who is directly responsible to you for the work done out there?—He is.

2715. Now, I assume your accountant is a very important man to you, and he, I understand, keeps all your statistics; he has to draw your attention to anything which may show an increase of cost?—Yes, he is continually in touch with me.

2716. But he does regularly bring before your notice the increase in the cost in various cases?—Every month we go very carefully through every item of expenditure, check it through, make all the comments necessary on each item, and then send it down to the Chief Commissioner.

2717. Then you will have noticed that your maintenance costs have rather gone up of recent years?—Yes.

2718. I see you have got an officer here who deals as far as I can see with nothing else but suggestions and inventions; is he fully employed?—He is.

2719. What sort of work is he employed upon?—We have a system on these railways whereby suggestions sent in by members of the staff for the improvement of anything that they think can be improved on the railways, are dealt with by a suggestions board. Then this board having found a suggestion apparently of interest or value to the locomotive department sends it addressed to me. Then it goes to this inventions and suggestions officer, who looks into the thing first of all from the practical point of view, and then he makes out a report.

2720. This is not a board, this is an officer?—No, the board has first of all selected this suggestion and sent it to me as something which the board considers the locomotive branch should give consideration to.

2721. And eventually it gets to this officer?—Yes, that is so.

2722. And he only gets suggestions and inventions which have gone from the board and been approved by you, and then he has to inquire into them?—That is so. He inquires into them with a view to discover if they are worthy of being used. He then makes a report which I get. Finally, if I approve that the suggestion be given a trial, that goes through the board again, and it is the duty of this man afterwards to trace the suggestion through the shops and its performances when it is actually in being.

2723. Is that all kinds of suggestions and inventions in connection with your department?—All kinds.

2724. Locomotive, carriage, and wagon?—Yes.

2724A. He must be a man of wide experience?—He is.

2725. What experience has he had?—We generally select a man who has had good bench experience, factory experience, and has been a teacher or inspector, or has had some occupation of that kind.

2726. Do you say carriages and waggons?—Yes, from drop pits to upholstery.

2727. Is he a workman?—He has been.

2728. What do you pay him?—I cannot answer that question at the moment, but I think it is somewhere in the vicinity of £350.\*

2729. He is not a technical man?—He is. He is a man who has served his time in the factory. He has worked in the factory, and he has risen up through the ranks.

2730. Has he passed examinations?—Yes.

2731. And he is worth £350?—I do not want you to take that as an accurate answer.

2732. However, he is fully and usefully employed?—Yes, we could not do without him.

2733. But if you try out all these inventions, is that not rather a responsibility?—We have had remarkably good results from some of the inventions.

2734. And some remarkably bad ones from others?—There is a percentage that has had to be thrown out.

2735. I have got a good deal here in connection with water, but I have asked you a question, too, about that; is there anything you would like to add to whatever you have mentioned in the memorandum you have sent me?—There is just one thing I would like to add, namely, a scheme that the Chief Commissioner has under consideration at the present time to dam the Mulwong River at Goulburn, which, when done, will have a very beneficial effect on the running of trains on the southern line.

2736. You agreed at the beginning of our interview this morning that on the capital value of your engines you put at thirty years' life, you would have to expend over £231,000 or build forty-five engines?—Yes.

2737. As a matter of fact, of course, you have not done anything of the kind?—No.

2738. And I see, taking the number of engines which you have built, that forty-five engines which should be built every year was assuming you keeping up your stock of engines or locomotives as it stands to-day?—Yes.

2739. But if you take from 1912—that is 1913, and so on—your miles open for traffic was 35 per cent. increase, and

that would necessitate more engines being supplied for working that traffic?—Yes.
